

# Structural RNA and viral sequence analysis

Eric Nawrocki

Intramural Research Program  
National Library of Medicine  
National Institutes of Health

## **Two main areas of my research:**

1. Viral sequence analysis tools, since 2015
2. Structural RNA analysis tools, since 2004

# GenBank indexers handle incoming sequence submissions

SOFTWARE

Open Access

# VADR: validation and annotation of virus sequence submissions to GenBank

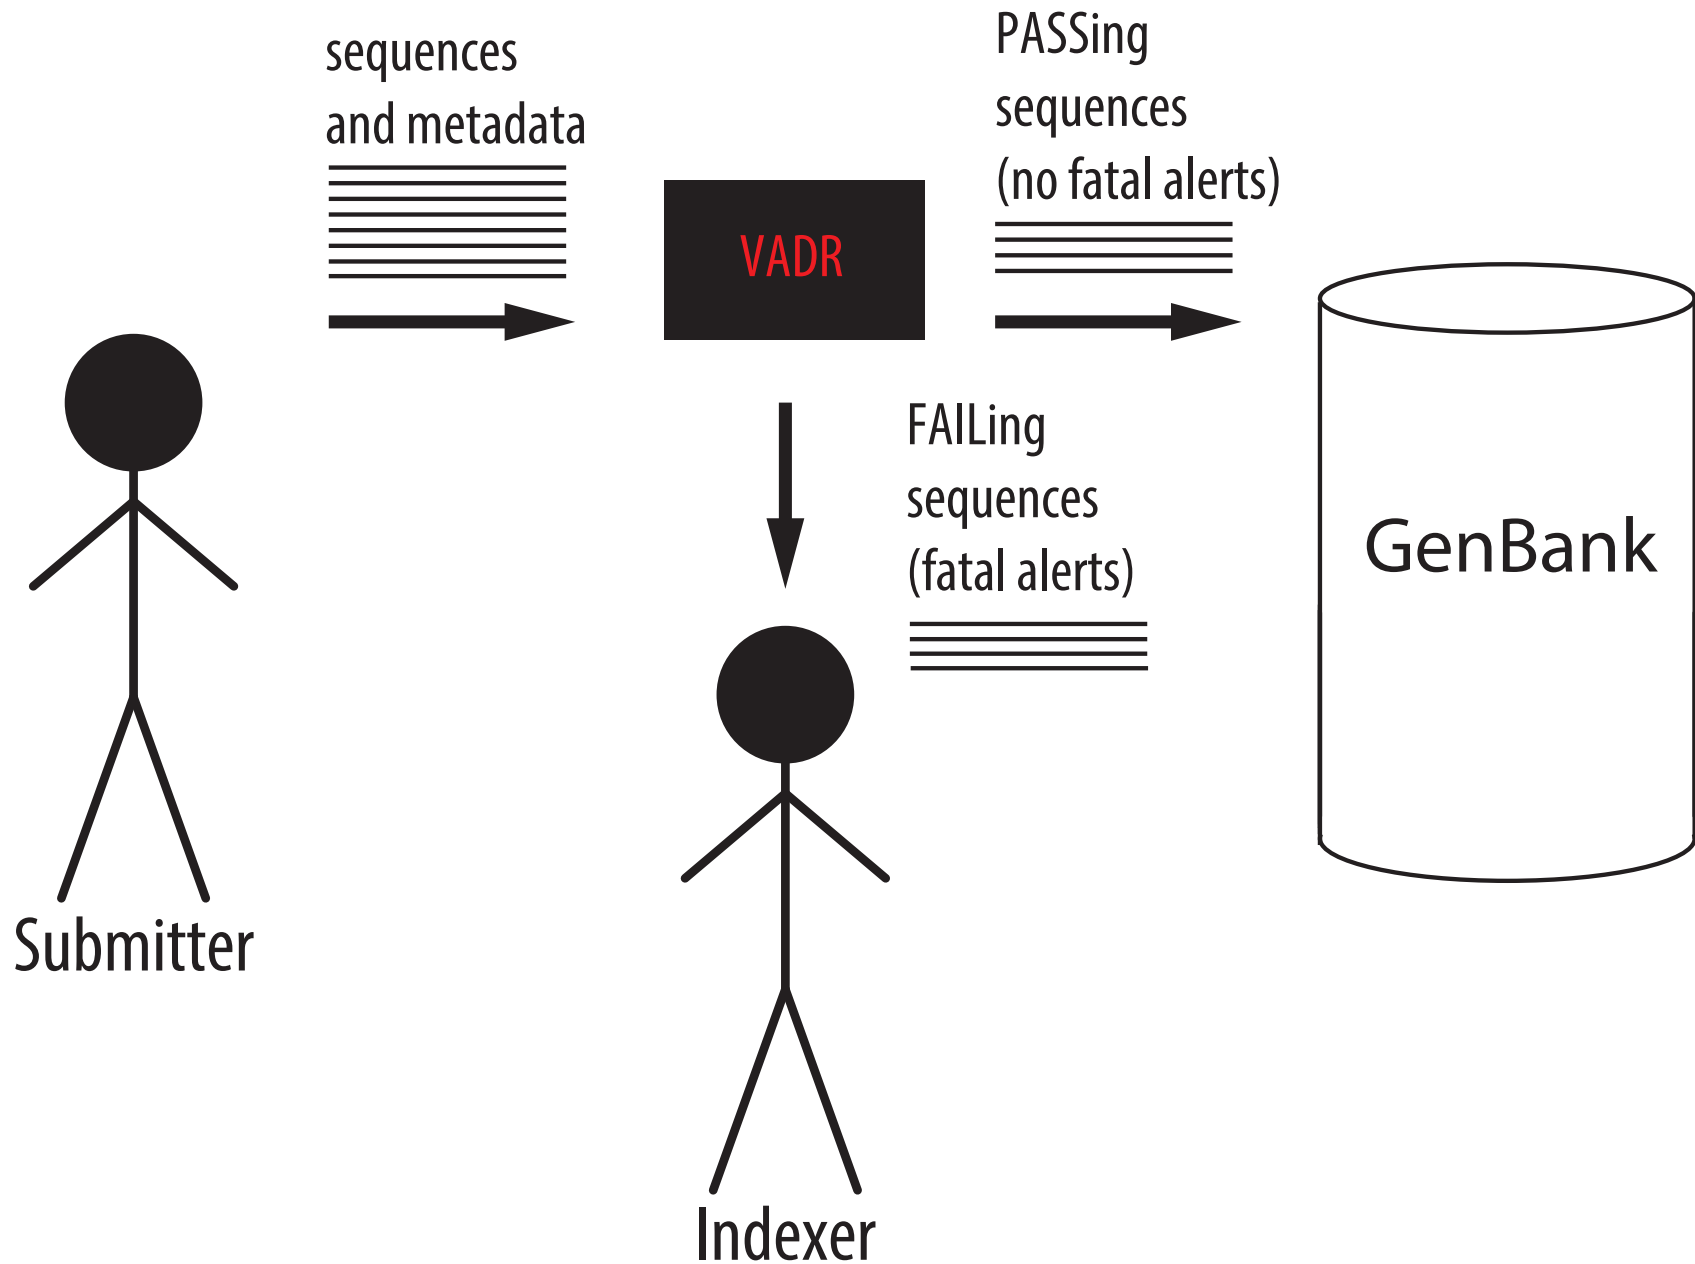

Alejandro A. Schäffer<sup>1,2</sup>, Eneida L. Hatcher<sup>2</sup>, Linda Yankie<sup>2</sup>, Lara Shonkwiler<sup>2,3</sup>, J. Rodney Brister<sup>2</sup>, Ilene Karsch-Mizrachi<sup>2</sup> and Eric P. Nawrocki<sup>2\*</sup> 

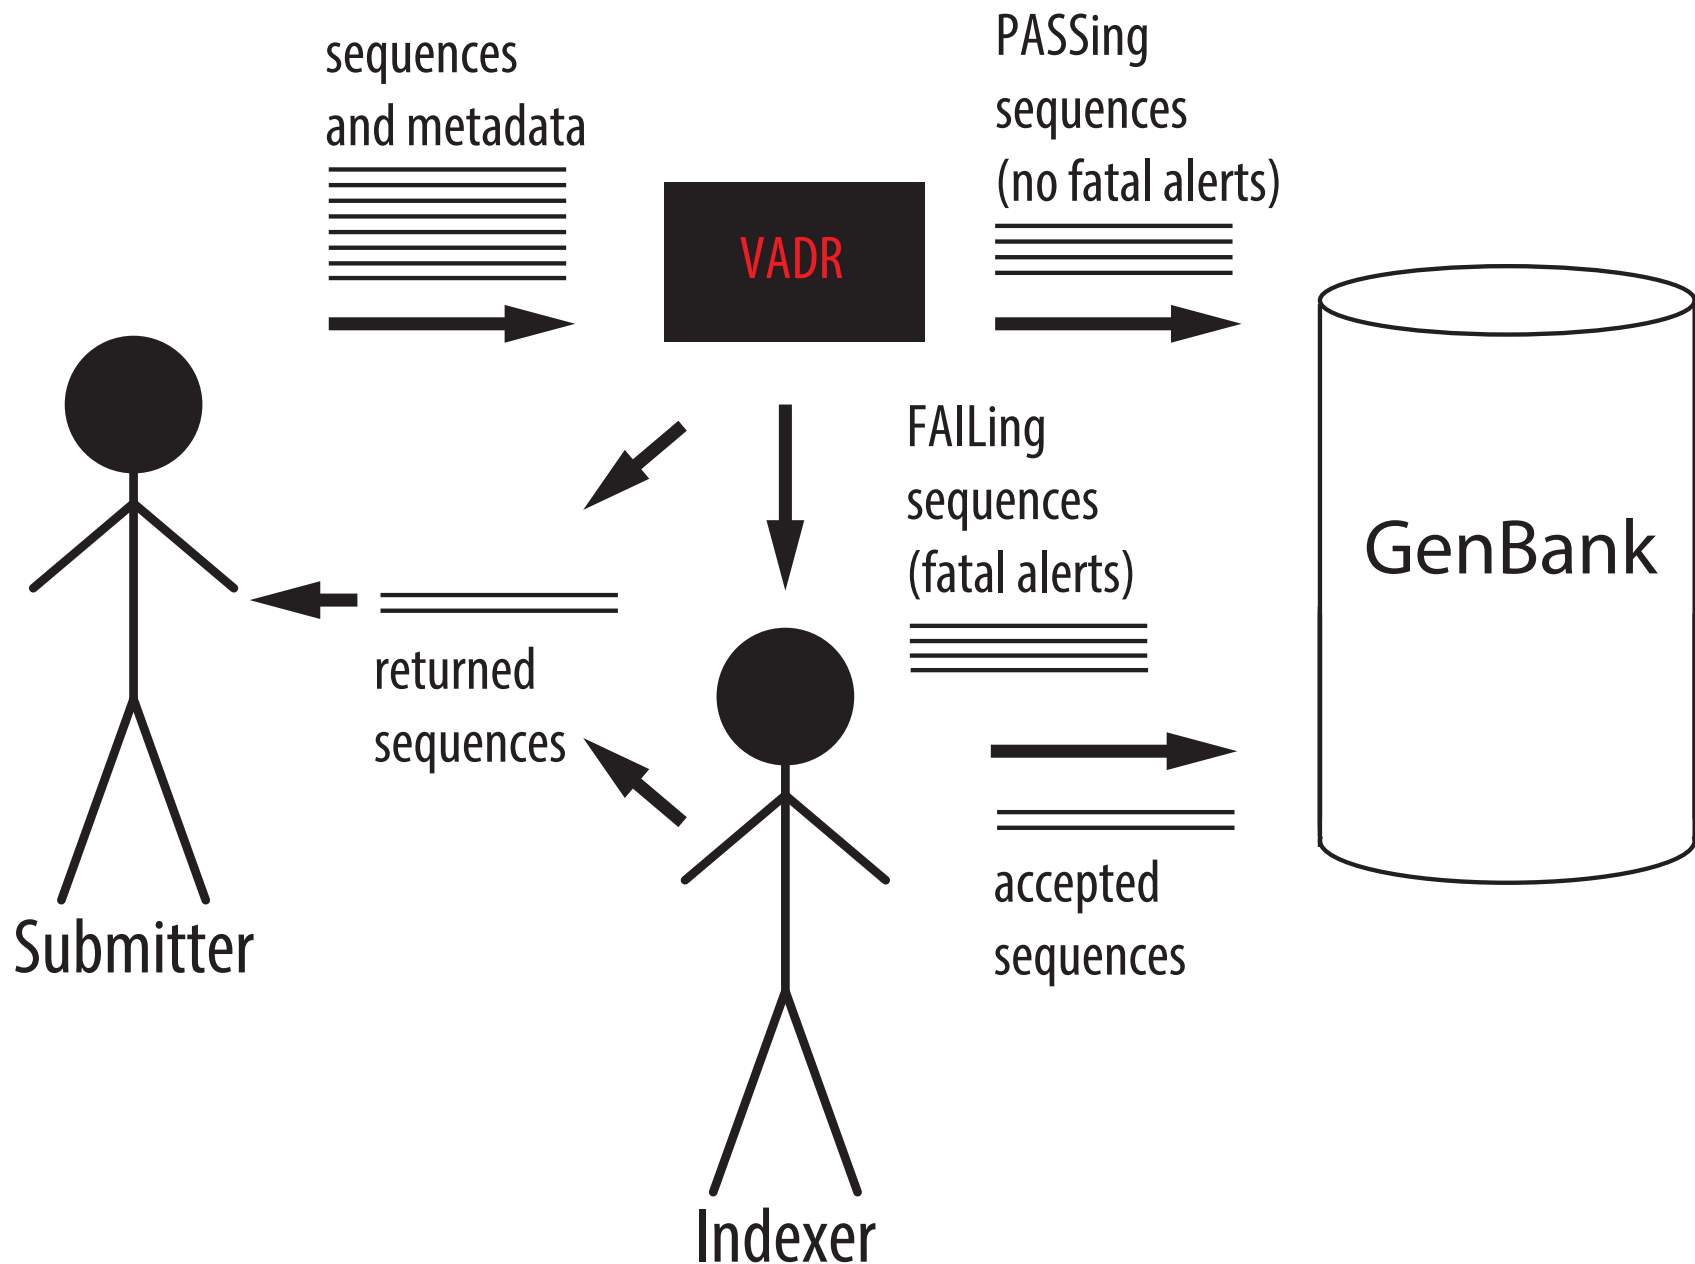

- general tool for reference-based annotation of viral sequences
- used for Norovirus and Dengue virus submissions since 2018
- used for SARS-CoV-2 submissions since March 2020
- currently also used manually for RSV, Mpox, and some Influenza submissions

# VADR assists GenBank indexers:

Each sequence **PASSes** or **FAILs**

Indexers decide fate of some **FAILing** sequences  
but some are sent directly back to submitter with error reports

# VADR proceeds over four stages to validate and annotate sequences

- For each sequence  $S$ :
  1. **Classification**: compare  $S$  to all models to find best matching model  $M$
  2. **Coverage determination**: search  $M$  against  $S$  to find 'hits'
  3. **Alignment**: align  $S$  to  $M$  and map features from  $M$  to  $S$
  4. **Protein validation**: compare predicted CDS in  $S$  to proteins from  $M$  using BLASTX

*Different types of alerts are identified and reported at each stage*

### Stage 3: Alignment and feature mapping

Align each sequence to its best-matching model

**NC\_001477**

*s*

early stop codon in CDS  
(cdsstopn alert)

# Stage 3: Alignment and feature mapping

Align each sequence to its best-matching model

**NC\_001477 MODEL** (Dengue - serotype 1)

**NC\_001477**

S

early stop codon in CDS  
(cdsstopn alert)

code	S/F	error message	description
<b>Fatal alerts detected in the annotation stage</b>			
unexdivg*	S	UNEXPECTED_DIVERGENCE	sequence is too divergent to confidently assign nucleotide-based annotation
noftrann*	S	NO_FEATURES_ANNOTATED	sequence similarity to homology model does not overlap with any features
mutstart	F	MUTATION_AT_START	expected start codon could not be identified
mutendcd	F	MUTATION_AT_END	expected stop codon could not be identified, predicted CDS stop by homology is invalid
mutendns	F	MUTATION_AT_END	expected stop codon could not be identified, no in-frame stop codon exists 3' of predicted valid start codon
mutendex	F	MUTATION_AT_END	expected stop codon could not be identified, first in-frame stop codon exists 3' of predicted stop position
unexleng	F	UNEXPECTED_LENGTH	length of complete coding (CDS or mat_peptide) feature is not a multiple of 3
cdsstopn	F	CDS_HAS_STOP_CODON	in-frame stop codon exists 5' of stop position predicted by homology to reference
peptrans	F	PEPTIDE_TRANSLATION_PROBLEM	mat_peptide may not be translated because its parent CDS has a problem
pepadjcy	F	PEPTIDE_ADJACENCY_PROBLEM	predictions of two mat_peptides expected to be adjacent are not adjacent
indfantn	F	INDEFINITE_ANNOTATION	nucleotide-based search identifies CDS not identified in protein-based search
indf5gap	F	INDEFINITE_ANNOTATION_START	alignment to homology model is a gap at 5' boundary
indf5loc	F	INDEFINITE_ANNOTATION_START	alignment to homology model has low confidence at 5' boundary
indf3gap	F	INDEFINITE_ANNOTATION_END	alignment to homology model is a gap at 3' boundary
indf3loc	F	INDEFINITE_ANNOTATION_END	alignment to homology model has low confidence at 3' boundary
lowsim5f	F	LOW_FEATURE_SIMILARITY_START	region within annotated feature at 5' end of sequence lacks significant similarity
lowsim3f	F	LOW_FEATURE_SIMILARITY_END	region within annotated feature at 3' end of sequence lacks significant similarity
lowsimif	F	LOW_FEATURE_SIMILARITY	region within annotated feature lacks significant similarity

## VADR used for Norovirus and Dengue virus sequences since 2018

	Norovirus	Dengue virus
length	7.6Kb	10.7Kb
# seqs	44,936	113,211
% seqs full length	5.1%	8.4%
% Ns	0.5%	0.2%
% seqs with stretch of $\geq 50$ Ns	1.0%	0.4%
average % identity	81.6%	94.4%

### VADR v1.0 performance

seconds per sequence	42.4	92.6
required RAM	8Gb	8Gb
total running time, CPU days	1.1	10.2

# SARS-CoV-2 sequence submissions have increased since early 2020

month	year	#new seqs	#cumulative seqs
Jan	2020	32	32
Feb	2020	58	90
Mar	2020	332	422
Apr	2020	1541	1963

# SARS-CoV-2 sequences differ from Norovirus and Dengue virus in several ways that impact VADR processing

	Norovirus	Dengue virus	SARS-CoV-2
length	7.6Kb	10.7Kb	29.9Kb
# seqs	44,936	113,211	1,616,891
% seqs full length	5.1%	8.4%	99.7%
% Ns	0.5%	0.2%	1.4%
% seqs with stretch of $\geq 50$ Ns	1.0%	0.4%	38.7%
average % identity	81.6%	94.4%	99.4%

## VADR v1.0 performance

seconds per sequence	42.4	92.6	331.8
required RAM	8Gb	8Gb	64Gb
total running time, CPU days	1.1	10.2	6187.6

Replacing Ns with expected nucleotides allows  
many 'good' sequences to pass

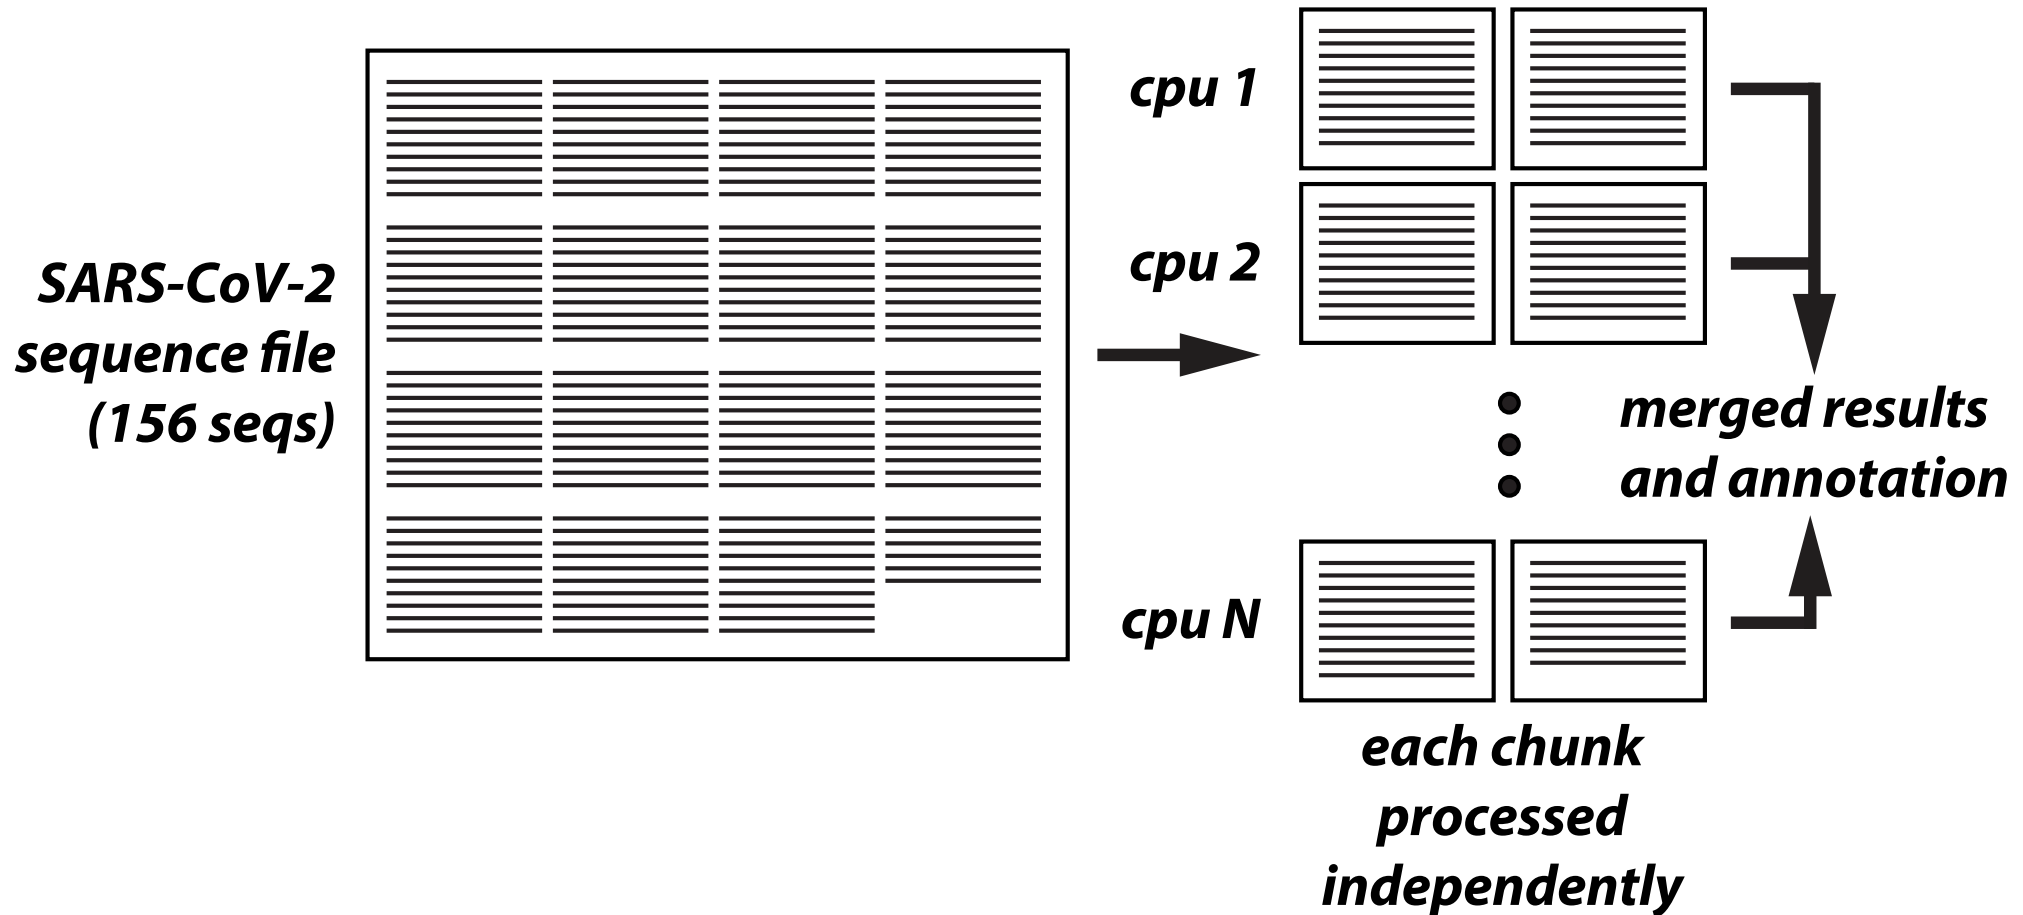

# Seeded alignment using blastn makes alignment stage faster

## Using glsearch instead of cmaln reduces memory requirement

- lower memory requirement (2Gb max) allows for multi-threading

**VADR is now 1000-fold faster in practice for SARS-CoV-2 processing**

VADR version	seeded align- ment?	N replace- ment?	glsearch?	# cpus	required RAM	secs per seq	hours per 100K seqs	speedup vs v1.0
v1.0	—	—	—	1	64 Gb	329.91	9164.3	-

**VADR is now 1000-fold faster in practice for SARS-CoV-2 processing**

**Besides getting faster, VADR has changed in other ways  
(work with Linda Yankie and Vince Calhoun and GenBank team)**

- 14 releases since March 2020
- 3 additional models (all eventually dropped):
  - B.1.1.7 (alpha)
  - B.1.525
  - 28254-deletion
- allow some alerts for non-essential ORFs without failing sequence  
(they become a `misc_feature` instead)

# **Faster SARS-CoV-2 sequence validation and annotation for GenBank using VADR**

**Eric P. Nawrocki** \*

National Center for Biotechnology Information, U.S. National Library of Medicine, National Institutes of Health,  
Bethesda, MD, 20894, USA

Received September 08, 2022; Revised November 28, 2022; Editorial Decision December 14, 2022; Accepted January 03, 2023

## **Additional VADR models and development**

- Respiratory Syncytial Virus (RSV) models
- Mpox virus
- Influenza models
  - compare with existing GenBank flu tool FLAN

## **Additional VADR models and development**

- Respiratory Syncytial Virus (RSV) models
- Mpox virus
- Influenza models
  - compare with existing GenBank flu tool FLAN

## **Additional VADR models and development**

- Respiratory Syncytial Virus (RSV) models
- Mpox virus
- Influenza models
- Zika models (in progress, EB Dickinson (postbac))
  - matches or exceeds performance of existing GenBank flu tool FLAN
  - able to annotate highly pathogenic avian influenza (H5N1)

---

# Influenza sequence validation and annotation using VADR

Vincent C. Calhoun, Eneida L. Hatcher, Linda Yankie, Eric P. Nawrocki \*

National Center for Biotechnology Information, U.S. National Library of Medicine, National Center for Biotechnology Information, 8600 Rockville Pike, Bethesda, MD 20894, United States

## **Additional VADR models and development**

- VADR is general, standalone and includes a module for users to build new models
- Alex Greninger's lab at Univ of Washington:
  - sequences a wide variety of human pathogenic viruses
  - previously developed the VAPiD software tool for validating and annotating viral sequences
  - now collaborates with me building VADR models:
    - \* Herpes Simplex Virus (HSV-1 and HSV-2) models
    - \* Human metapneumovirus (HMPV) models

## **VADR and NCBI virus**

- FY2025 NCBI virus goals related to VADR:
  - VADR web server
  - Replacement of FLAN with VADR

## Future directions

- More models (our group and Greninger lab)
- Alignment-based models
- RNA structure annotation in Flaviviruses (already exists for Dengue)

# Structural RNA sequence analysis

- intro to Infernal
- intro to Rfam
- intro to RNACentral?
- intro to R2DT?
- RNA annotation: PGAP, Euk genomes (?), Hydractinia genomes
- tmRNA DB
