

Structural RNA and viral sequence analysis

Eric Nawrocki

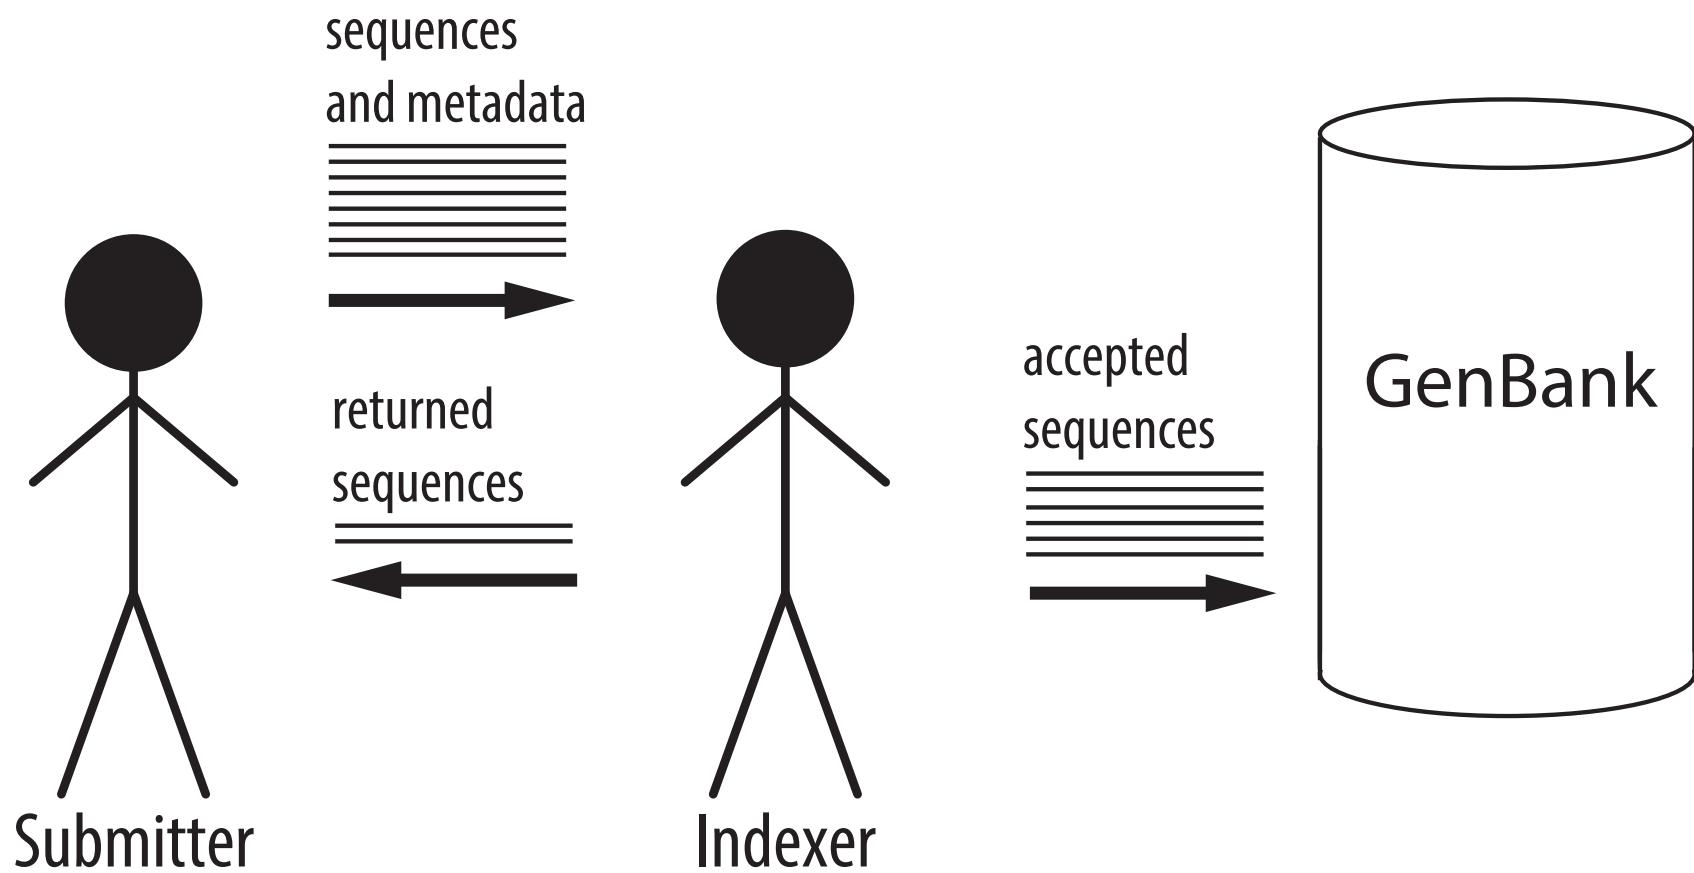

Intramural Research Program
National Library of Medicine
National Institutes of Health

Two main areas of my research:

1. Viral sequence analysis tools, since 2015
2. Structural RNA analysis tools, since 2004

GenBank indexers handle incoming sequence submissions

SOFTWARE

Open Access

VADR: validation and annotation of virus sequence submissions to GenBank

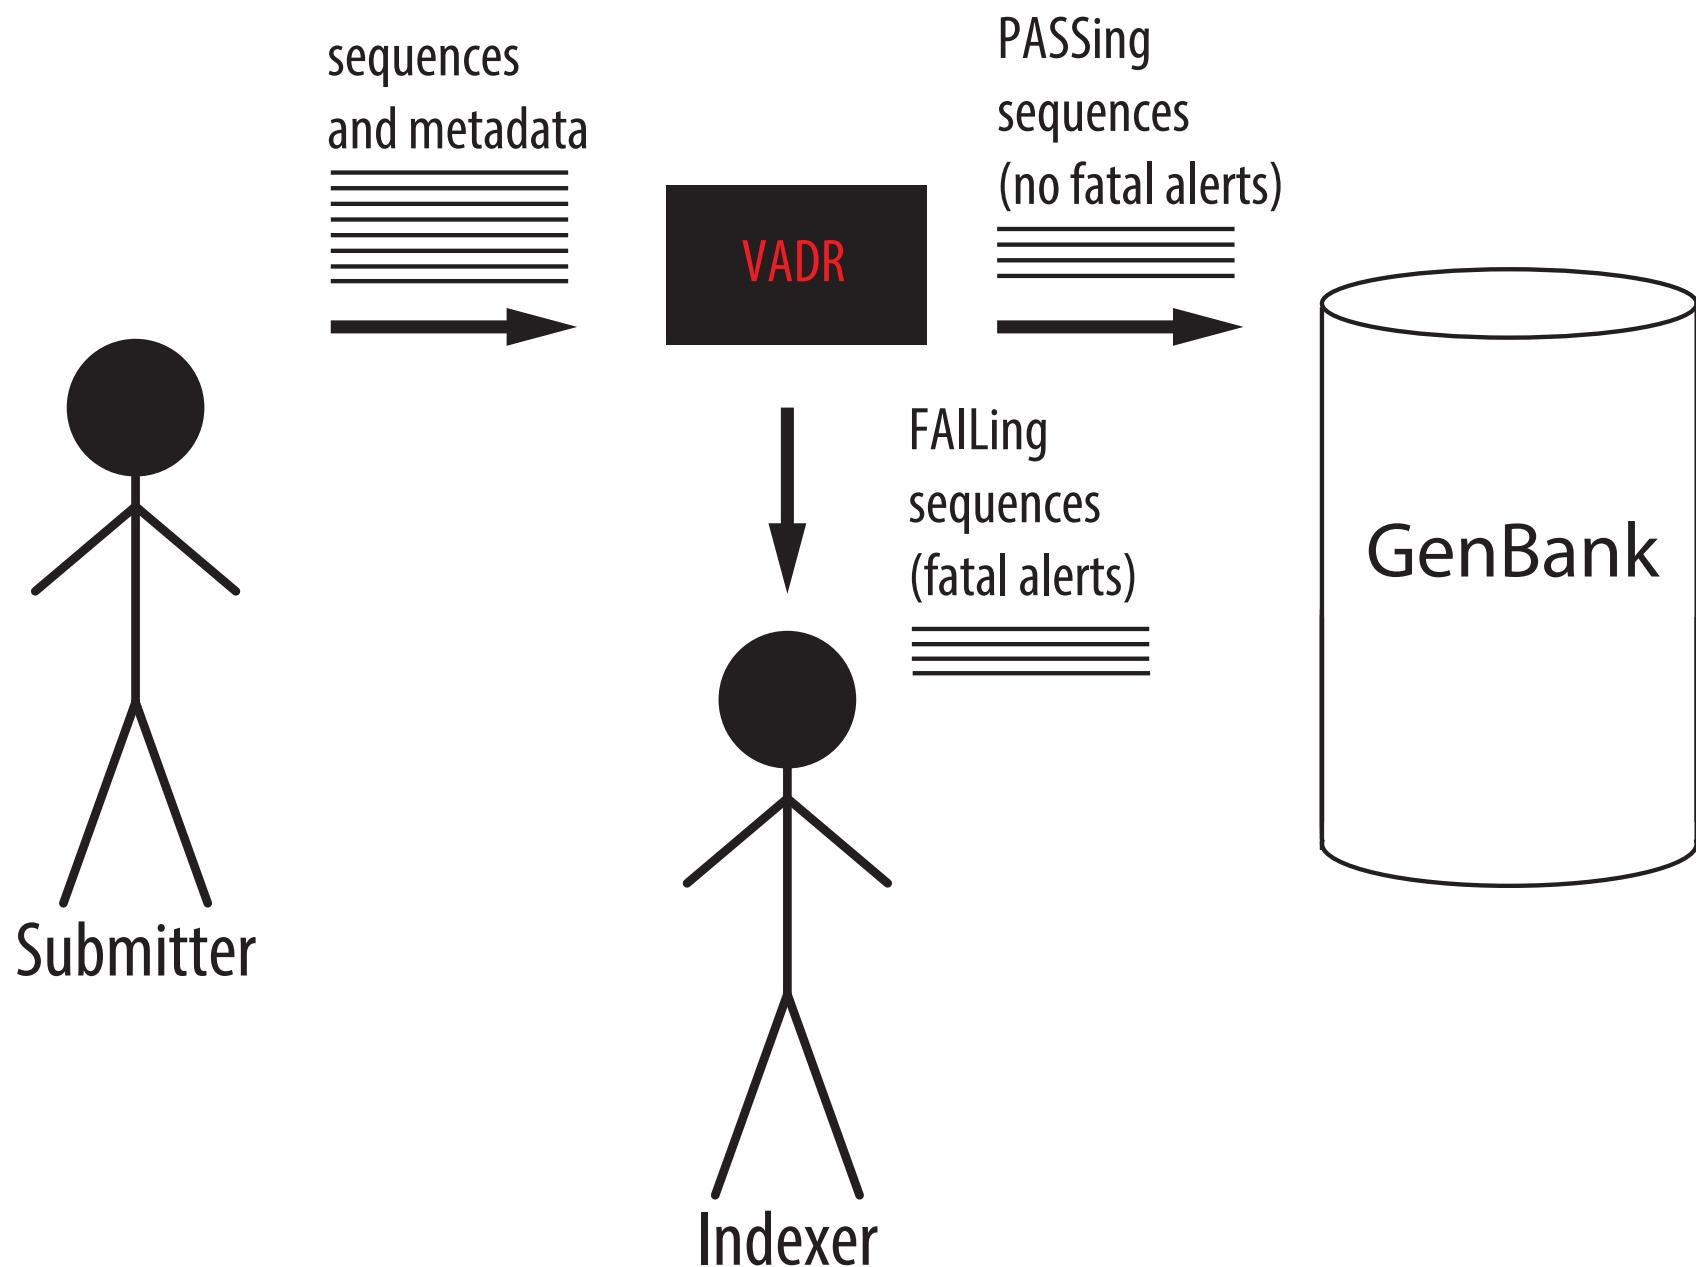

Alejandro A. Schäffer^{1,2}, Eneida L. Hatcher², Linda Yankie², Lara Shonkwiler^{2,3}, J. Rodney Brister², Ilene Karsch-Mizrachi² and Eric P. Nawrocki^{2*} 

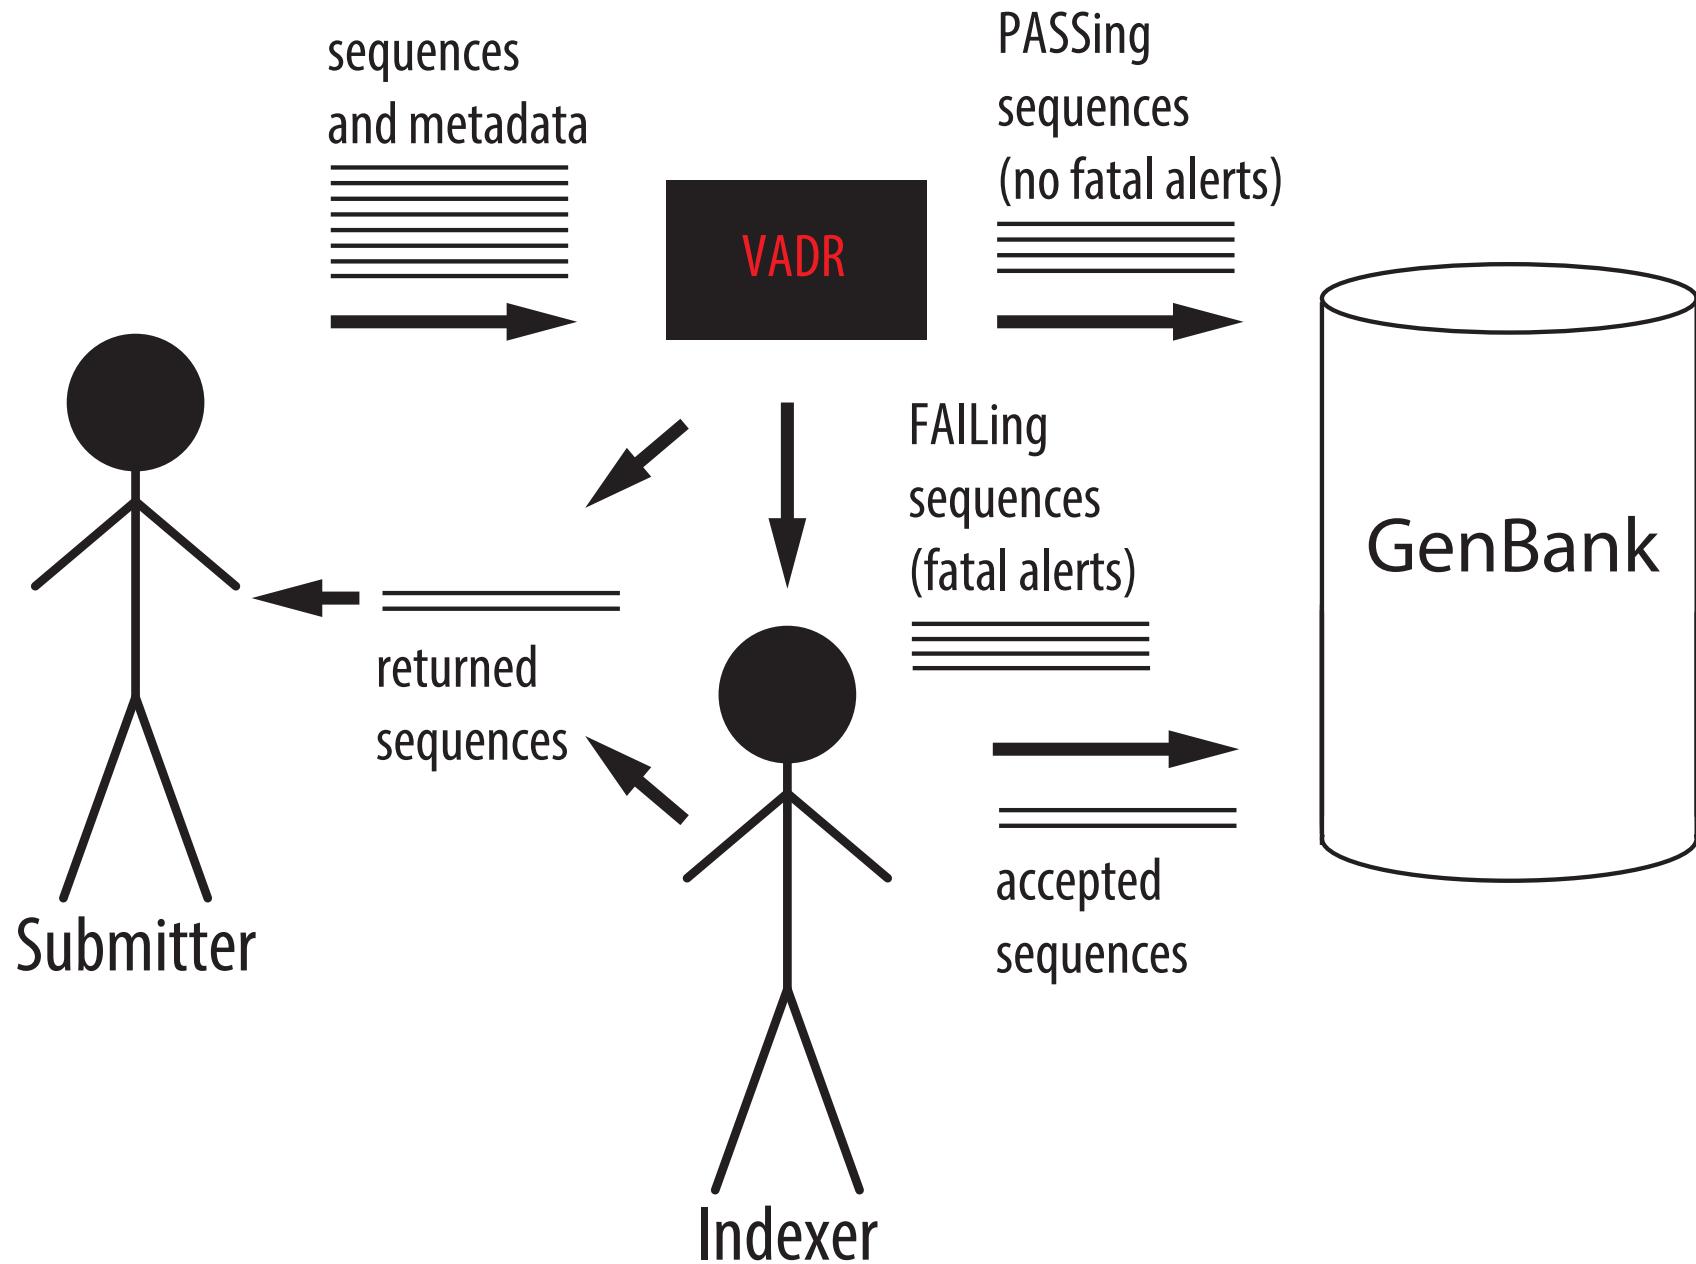

- general tool for reference-based annotation of viral sequences
- used for Norovirus and Dengue virus submissions since 2018
- used for SARS-CoV-2 submissions since March 2020
- currently also used manually for RSV, MpoX, and some Influenza submissions

VADR assists GenBank indexers:

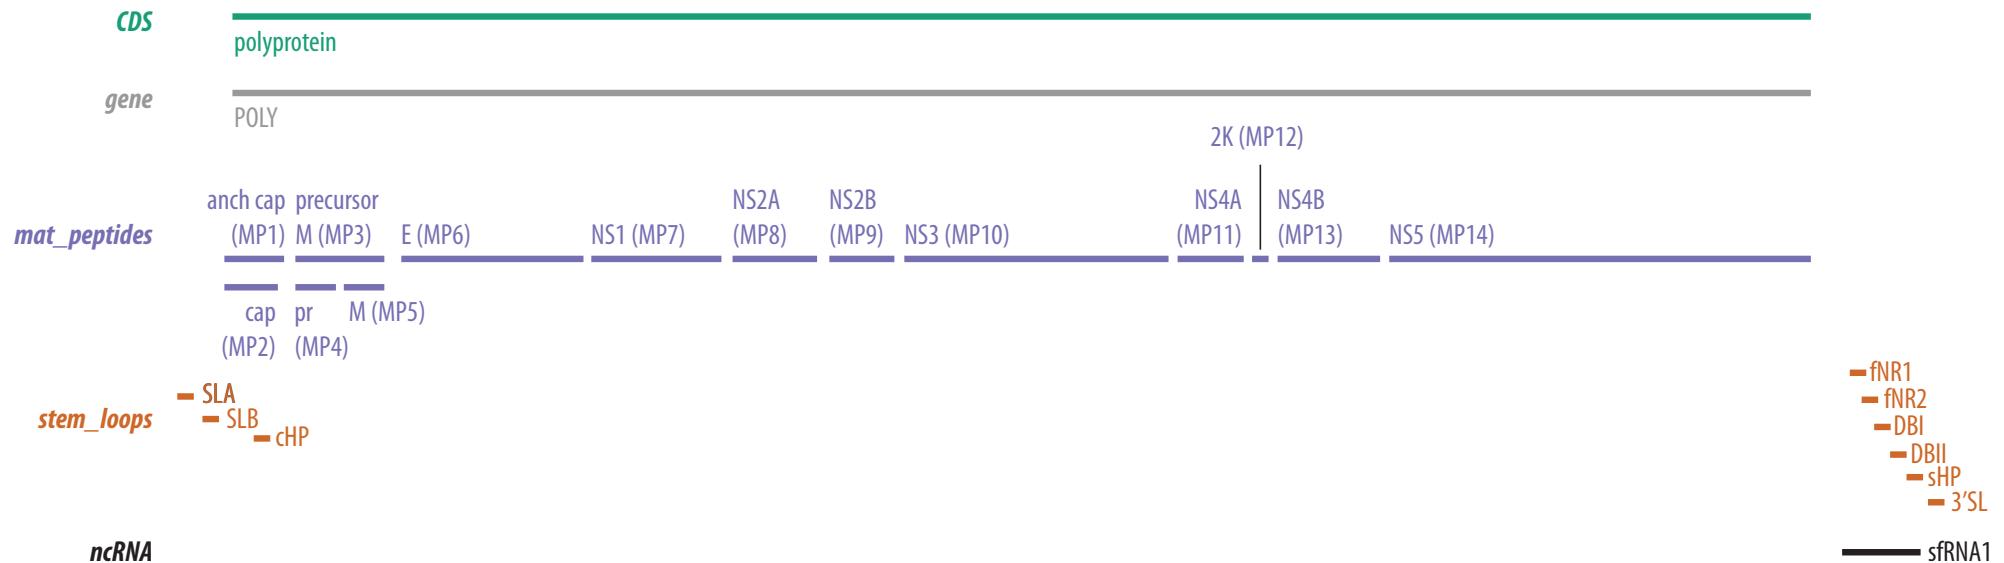

Each sequence **PASSes** or **FAILs**

**Indexers decide fate of some FAILing sequences
but some are sent directly back to submitter with error reports**

VADR builds a reference model of a RefSeq and its features

NC_001477 MODEL

Group: Dengue; Subgroup: 1

VADR validates and annotates each input sequence using its best-matching model

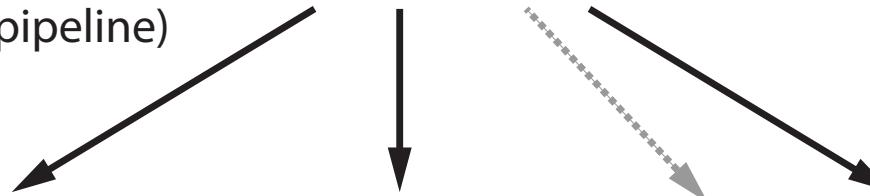

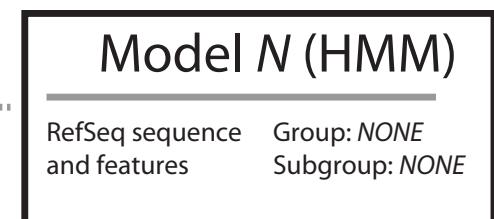

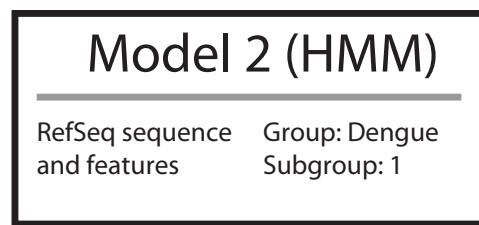

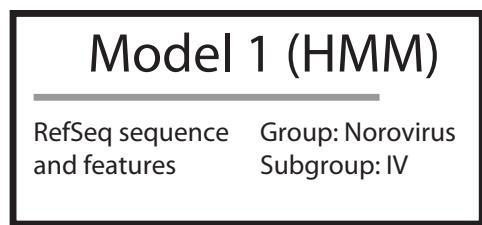

- Each sequence S proceeds through 4 stages:
 1. **Classification**
 2. **Coverage determination**
 3. **Alignment**
 4. **Protein validation**

Different types of alerts are identified and reported at each stage

Stage 1: Classification

Score each sequence
with all models
(HMMER3 shortened pipeline)

input sequences:

low HMM score

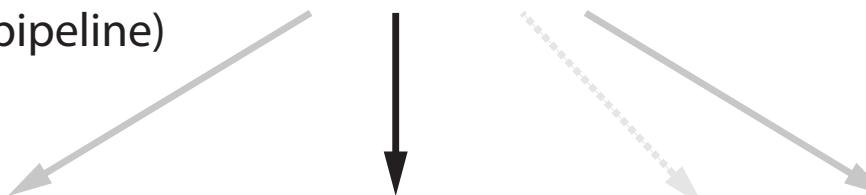

highest HMM score

low HMM score

Stage 1: Classification

Score each sequence
with all models
(HMMER3 shortened pipeline)

input sequences:

Model 1 (HMM)

RefSeq sequence
and features Group: Norovirus
Subgroup: IV

Model 2 (HMM)

RefSeq sequence
and features Group: Dengue
Subgroup: 1

Model N (HMM)

RefSeq sequence
and features Group: NONE
Subgroup: NONE

low HMM score

highest HMM score

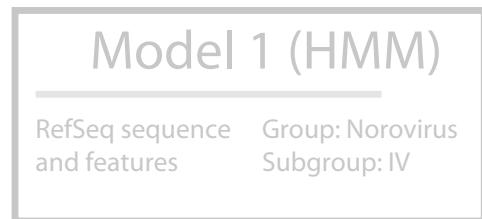

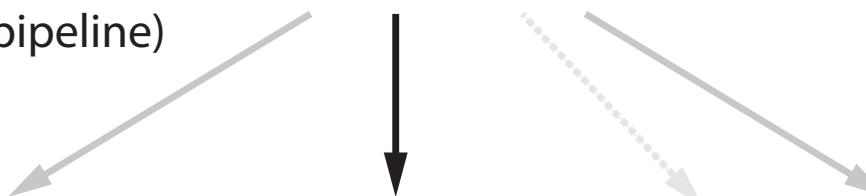

low HMM score

***best-matching model
used in remaining stages***

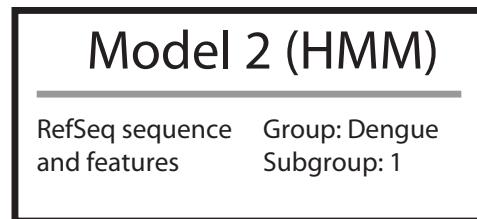

Stage 1: Classification

Score each sequence
with all models
(HMMER3 shortened pipeline)

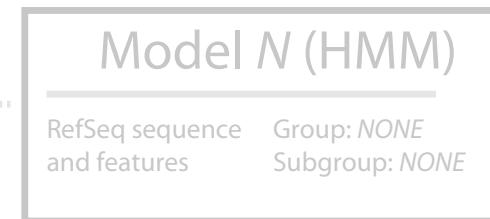

input sequences:

low HMM score

highest HMM score

low HMM score

***best-matching model
used in remaining stages***

code	S/F	error message	description
Fatal alerts detected in the classification stage			
noannotn*	S	NO_ANNOTATION	no significant similarity detected
revcompl*	S	REVCOMPLEM	sequence appears to be reverse complemented
incsbgrp	S	INCORRECT_SPECIFIED_SUBGROUP	score difference too large between best overall model and best specified subgroup model
incgroup	S	INCORRECT_SPECIFIED_GROUP	score difference too large between best overall model and best specified group model
Non-fatal alerts detected in the classification stage			
qstsbgp	S	QUESTIONABLE_SPECIFIED_SUBGROUP	best overall model is not from specified subgroup
qstgroup	S	QUESTIONABLE_SPECIFIED_GROUP	best overall model is not from specified group
indfclas	S	INDEFINITE_CLASSIFICATION	low score difference between best overall model and second best model (not in best model's subgroup)
lowscore	S	LOW_SCORE	score to homology model below low threshold

Stage 2: Coverage determination

Search each sequence with best-matching model (HMMER3 full pipeline)

input sequences that match best to NC_001477:

S1 _____
S2 _____
S3 _____
S4 _____

NC_001477 MODEL

Group: Dengue; Subgroup: 1

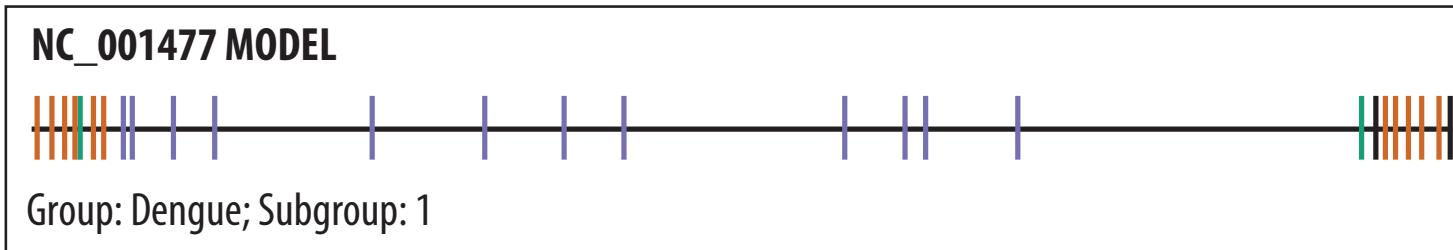

NC_001477 full length sequence
S1 (expected)
NC_001477 partial or truncated sequence
S2 (expected)

Stage 2: Coverage determination

Search each sequence with best-matching model (HMMER3 full pipeline)

input sequences that match best to NC_001477:

S1 _____
S2 _____
S3 _____
S4 _____

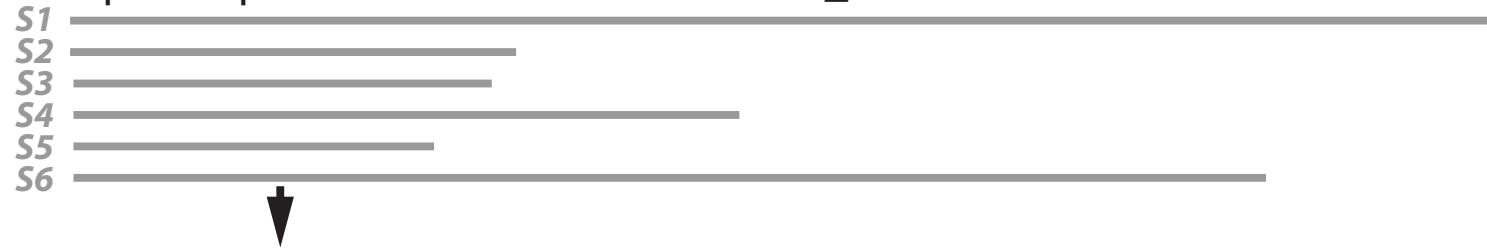

code	S/F	error message	description
Fatal alerts detected in the coverage stage			
lowcovrg	S	LOW_COVERAGE	low sequence fraction with significant similarity to homology model
dupregin	S	DUPLICATE_REGIONS	similarity to a model region occurs more than once
discontn	S	DISCONTINUOUS_SIMILARITY	not all hits are in the same order in the sequence and the homology model
indfstrn	S	INDEFINITE_STRAND	significant similarity detected on both strands
lowsim5s	S	LOW_SIMILARITY_START	significant similarity not detected at 5' end of the sequence
lowsim3s	S	LOW_SIMILARITY_END	significant similarity not detected at 3' end of the sequence
lowsimis	S	LOW_SIMILARITY	internal region without significant similarity
Non-fatal alerts detected in the coverage stage			
biasdseq	S	BIASED_SEQUENCE	high fraction of score attributed to biased sequence composition

Stage 3: Alignment and feature mapping

Align each sequence to its best-matching model (Infernal's cmalign)

input sequences that match best to NC_001477:

NC_001477 MODEL

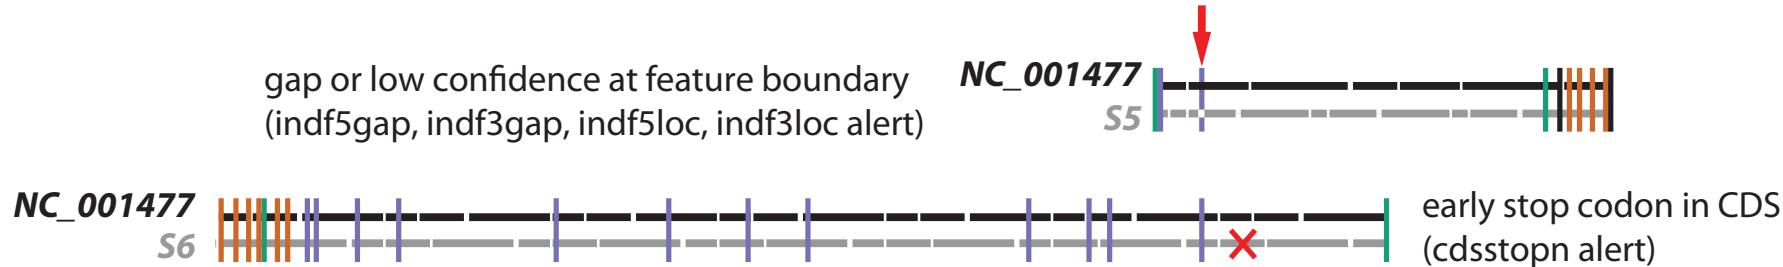

Group: Dengue; Subgroup: 1

Stage 3: Alignment and feature mapping

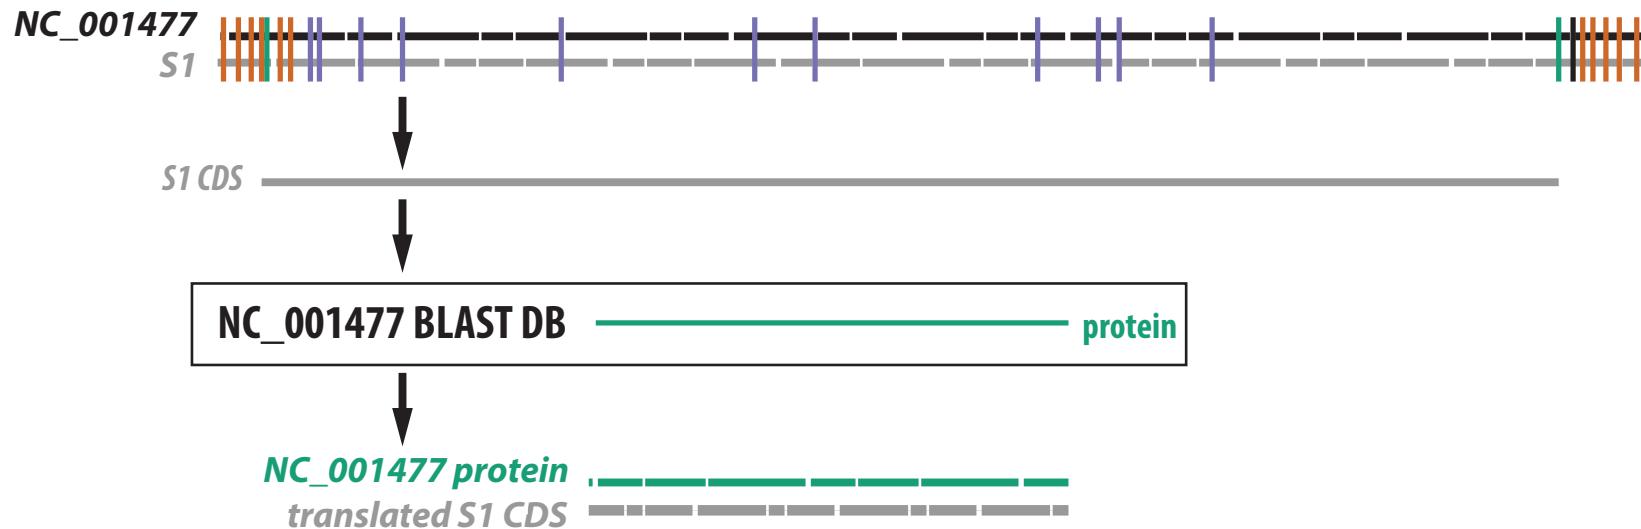

Align each sequence to its best-matching model (Infernal's cmalign)

code	S/F	error message	description
Fatal alerts detected in the annotation stage			
unexdivg*	S	UNEXPECTED_DIVERGENCE	sequence is too divergent to confidently assign nucleotide-based annotation
noftrann*	S	NO_FEATURES_ANNOTATED	sequence similarity to homology model does not overlap with any features
mutstart	F	MUTATION_AT_START	expected start codon could not be identified
mutendcd	F	MUTATION_AT_END	expected stop codon could not be identified, predicted CDS stop by homology is invalid
mutendns	F	MUTATION_AT_END	expected stop codon could not be identified, no in-frame stop codon exists 3' of predicted valid start codon
mutendex	F	MUTATION_AT_END	expected stop codon could not be identified, first in-frame stop codon exists 3' of predicted stop position
unexleng	F	UNEXPECTED_LENGTH	length of complete coding (CDS or mat_peptide) feature is not a multiple of 3
cdsstoppn	F	CDS_HAS_STOP_CODON	in-frame stop codon exists 5' of stop position predicted by homology to reference
peptrans	F	PEPTIDE_TRANSLATION_PROBLEM	mat_peptide may not be translated because its parent CDS has a problem
pepadjcy	F	PEPTIDE_ADJACENCY_PROBLEM	predictions of two mat_peptides expected to be adjacent are not adjacent
indfantn	F	INDEFINITE_ANNOTATION	nucleotide-based search identifies CDS not identified in protein-based search
indf5gap	F	INDEFINITE_ANNOTATION_START	alignment to homology model is a gap at 5' boundary
indf5loc	F	INDEFINITE_ANNOTATION_START	alignment to homology model has low confidence at 5' boundary
indf3gap	F	INDEFINITE_ANNOTATION_END	alignment to homology model is a gap at 3' boundary
indf3loc	F	INDEFINITE_ANNOTATION_END	alignment to homology model has low confidence at 3' boundary
lowsim5f	F	LOW FEATURE SIMILARITY_START	region within annotated feature at 5' end of sequence lacks significant similarity
lowsim3f	F	LOW FEATURE SIMILARITY_END	region within annotated feature at 3' end of sequence lacks significant similarity
lowsimif	F	LOW FEATURE SIMILARITY	region within annotated feature lacks significant similarity

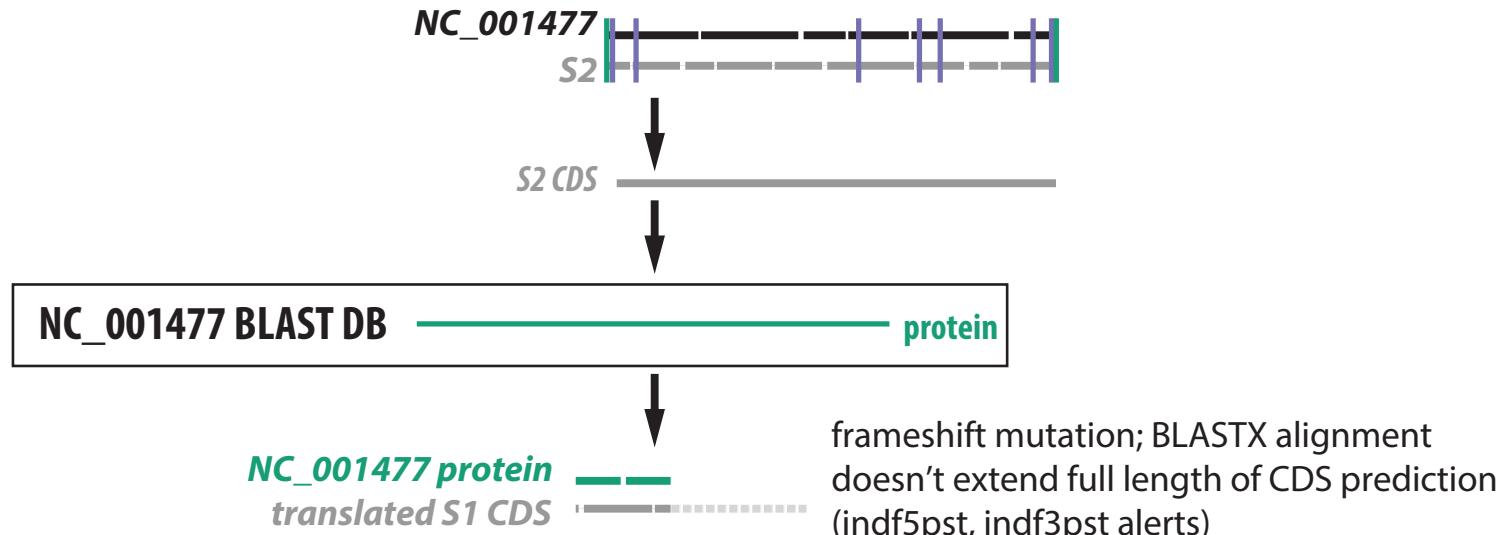

Stage 4: Protein validation (Alejandro Schäffer)

Compare each predicted CDS to model (RefSeq) proteins with BLASTX

Stage 4: Protein validation (Alejandro Schäffer)

Compare each predicted CDS to model (RefSeq) proteins with BLASTX

code	S/F	error message	description
Fatal alerts detected in the protein validation stage			
cdsstopp	F	CDS_HAS_STOP_CODON	stop codon in protein-based alignment
indfantp	F	INDEFINITE_ANNOTATION	protein-based search identifies CDS not identified in nucleotide-based search
indf5plg	F	INDEFINITE_ANNOTATION_START	protein-based alignment extends past nucleotide-based alignment at 5' end
indf5pst	F	INDEFINITE_ANNOTATION_START	protein-based alignment does not extend close enough to nucleotide-based alignment 5' endpoint
indf3plg	F	INDEFINITE_ANNOTATION_END	protein-based alignment extends past nucleotide-based alignment at 3' end
indf3pst	F	INDEFINITE_ANNOTATION_END	protein-based alignment does not extend close enough to nucleotide-based alignment 3' endpoint
indfstrp	F	INDEFINITE_STRAND	strand mismatch between protein-based and nucleotide-based predictions
insertnp	F	INSERTION_OF_NT	too large of an insertion in protein-based alignment
deletinp	F	DELETION_OF_NT	too large of a deletion in protein-based alignment

VADR used for Norovirus and Dengue virus sequences since 2018

	Norovirus	Dengue virus
length	7.6Kb	10.7Kb
# seqs	44,936	113,211
% seqs full length	5.1%	8.4%
% Ns	0.5%	0.2%
% seqs with stretch of \geq 50 Ns	1.0%	0.4%
average % identity	81.6%	94.4%

VADR v1.0 performance

seconds per sequence	42.4	92.6
required RAM	8Gb	8Gb
total running time, CPU days	1.1	10.2

SARS-CoV-2 sequence submissions have increased since early 2020

month	year	#new seqs	#cumulative seqs
Jan	2020	32	32
Feb	2020	58	90
Mar	2020	332	422
Apr	2020	1541	1963
May	2020	2974	4937
Jun	2020	3394	8331
Jul	2020	3604	11,935
Aug	2020	3818	15,753
Sep	2020	6731	22,484
Oct	2020	11,939	34,423
Nov	2020	4274	38,697
Dec	2020	4530	43,227
Jan	2021	8775	52,002
Feb	2021	26,078	78,080
Mar	2021	42,607	120,687
Apr	2021	97,095	217,782
May	2021	104,729	322,511
Jun	2021	46,187	368,698
Jul	2021	43,336	412,034
Aug	2021	141,958	553,992
Sep	2021	267,562	821,554
Oct	2021	239,296	1,060,850

Dec	2021	288,771	1,616,891
Jan	2022	258,522	1,875,413
Feb	2022	230,185	2,105,598

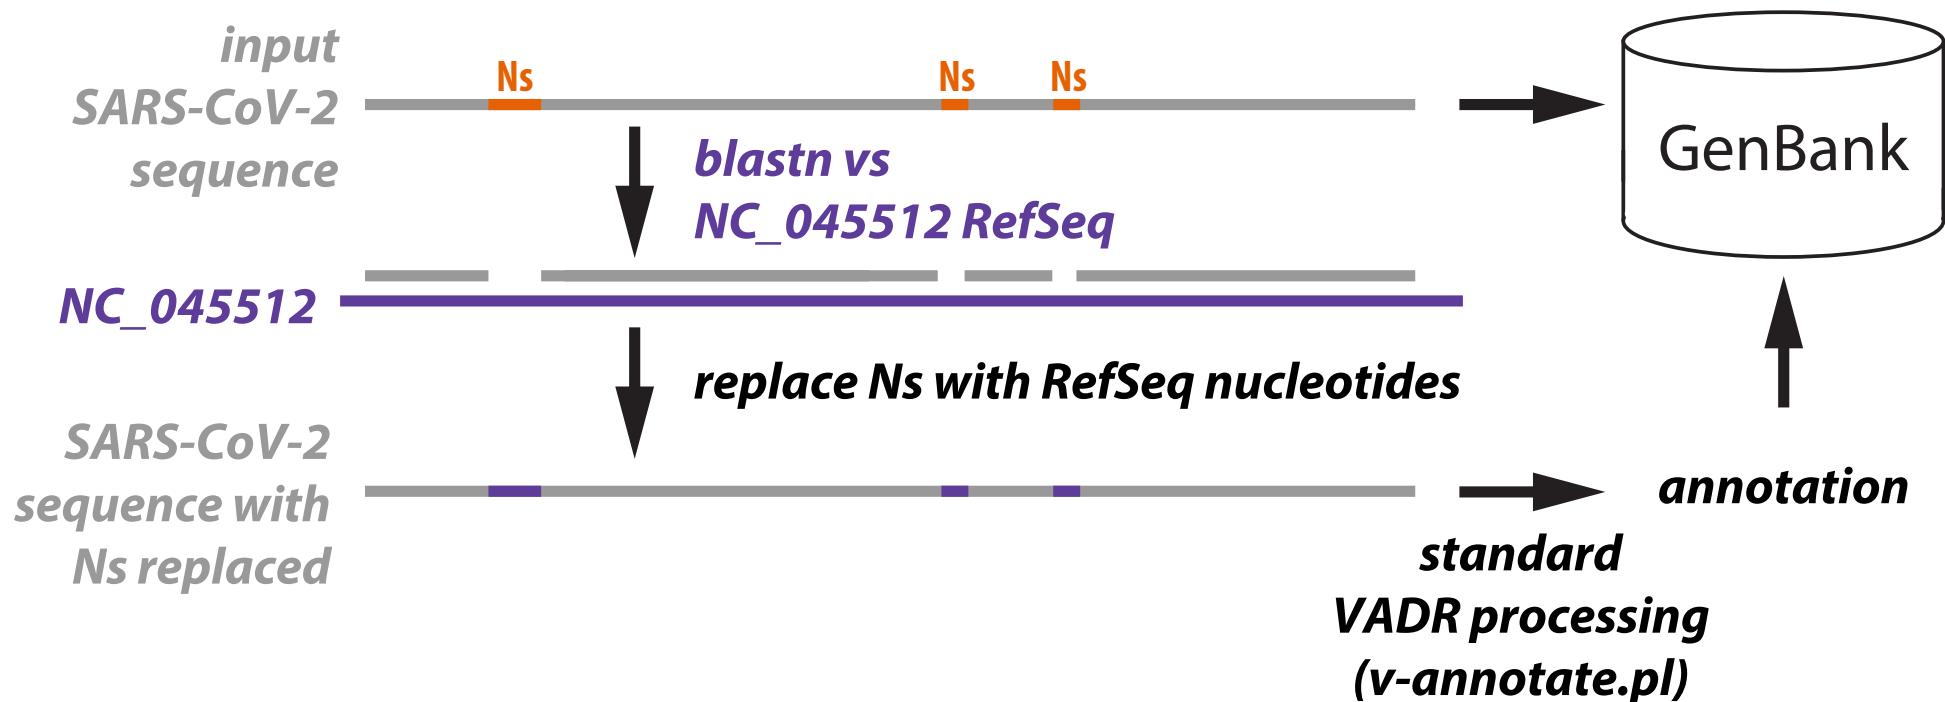

SARS-CoV-2 sequences differ from Norovirus and Dengue virus in several ways that impact VADR processing

	Norovirus	Dengue virus	SARS-CoV-2
length	7.6Kb	10.7Kb	29.9Kb
# seqs	44,936	113,211	1,616,891
% seqs full length	5.1%	8.4%	99.7%
% Ns	0.5%	0.2%	1.4%
% seqs with stretch of \geq 50 Ns	1.0%	0.4%	38.7%
average % identity	81.6%	94.4%	99.4%

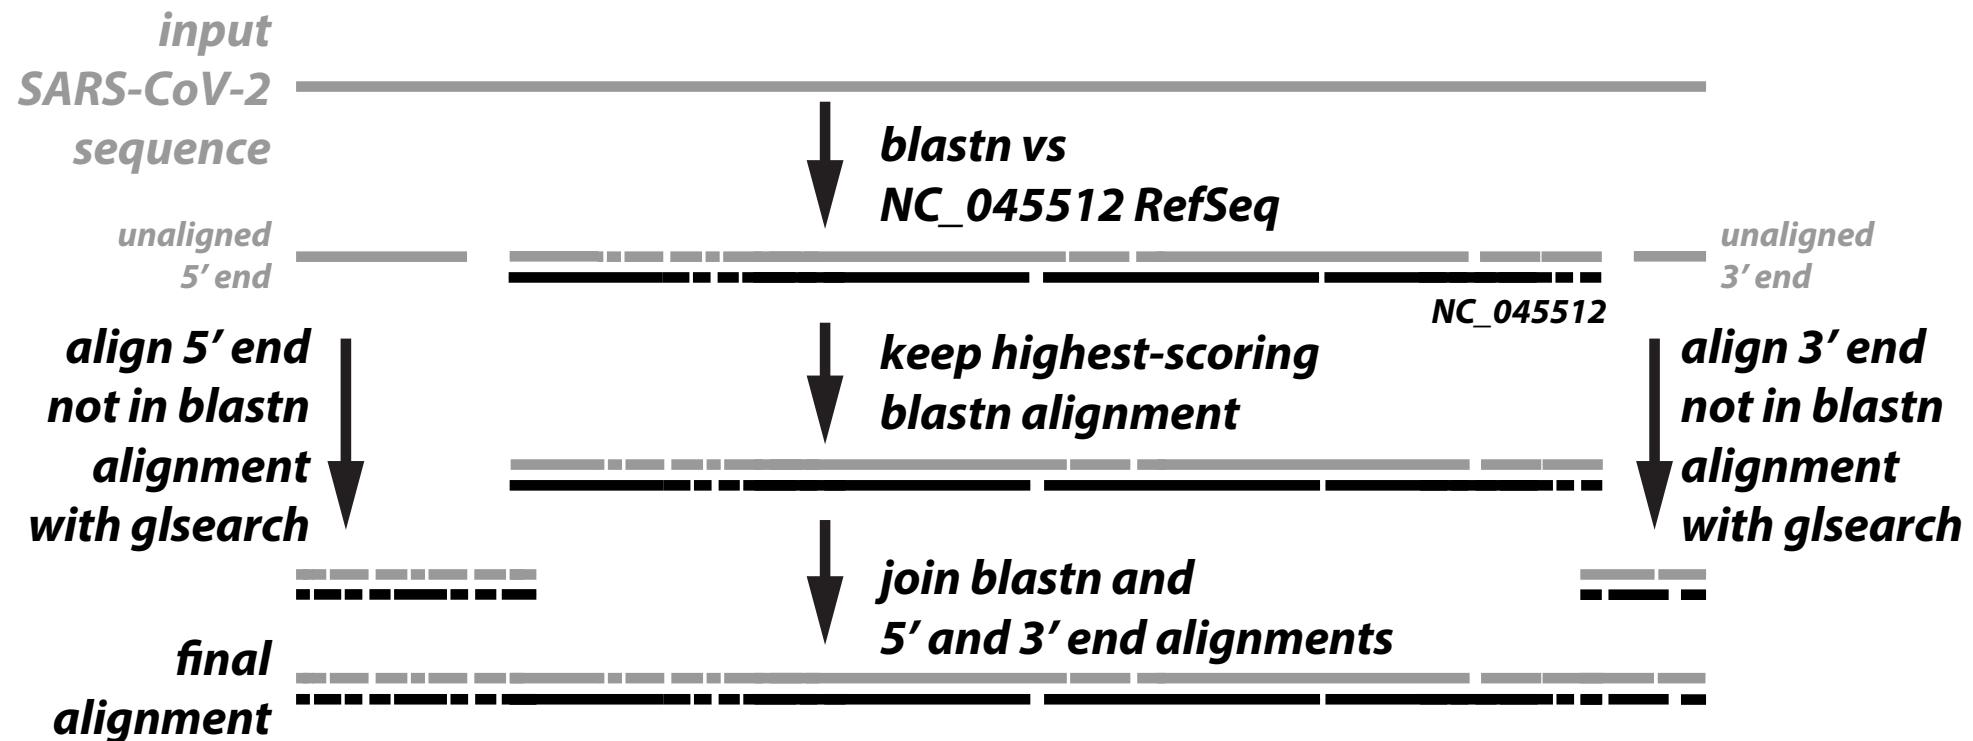

VADR v1.0 performance

seconds per sequence	42.4	92.6	331.8
required RAM	8Gb	8Gb	64Gb
total running time, CPU days	1.1	10.2	6187.6

Replacing Ns with expected nucleotides allows many 'good' sequences to pass

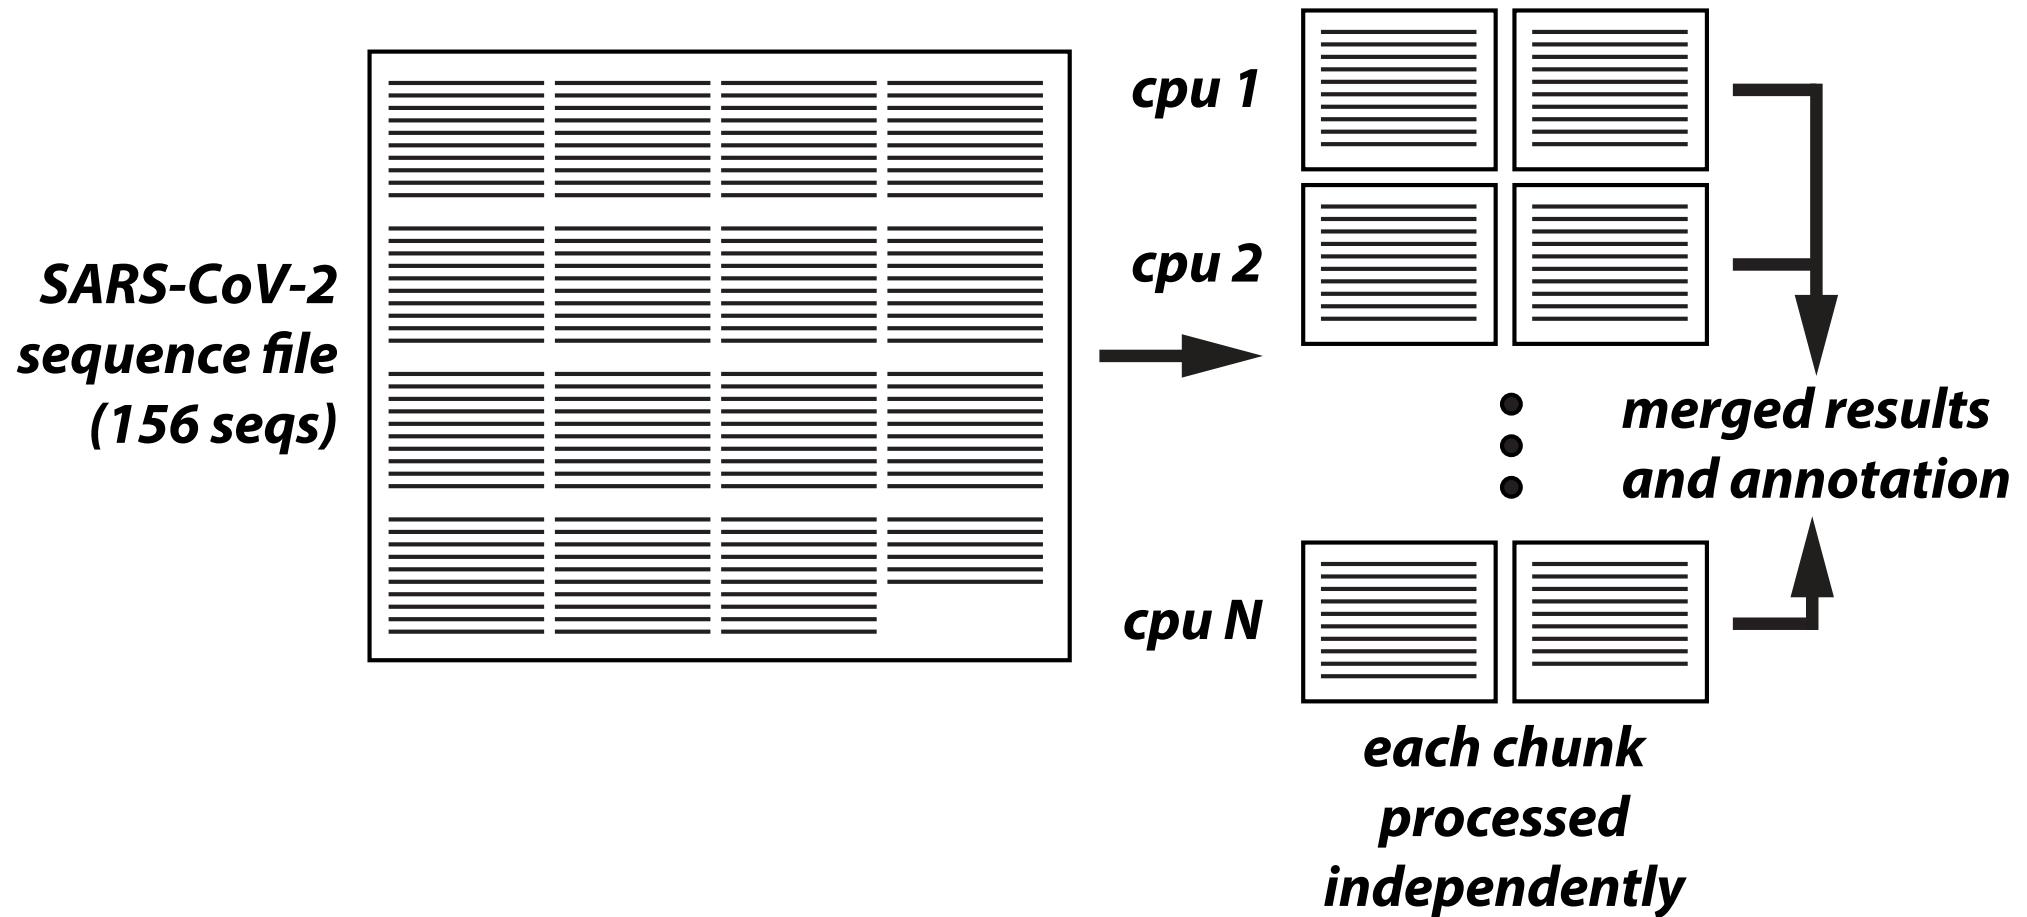

Seeded alignment using blastn makes alignment stage faster

Using glsearch instead of cmalign reduces memory requirement

- lower memory requirement (2Gb max) allows for multi-threading

VADR is now 1000-fold faster in practice for SARS-CoV-2 processing

VADR version	seeded alignment?	N replacement?	glsearch?	# cpus	required RAM	secs per seq	hours per 100K seqs	speedup vs v1.0
v1.0	-	-	-	1	64 Gb	329.91	9164.3	-
v1.4.1	+	+	+	8	16 Gb	0.33	9.3	986.8

VADR is now fast enough to handle hundreds of thousands of sequences per month

month	year	#new seqs	#cumulative seqs
Jan	2020	32	32

Dec	2021	288,771	1,616,891
Jan	2022	258,522	1,875,413
Feb	2022	230,185	2,105,598

**Besides getting faster, VADR has changed in other ways
(work with Linda Yankie and Vince Calhoun and GenBank team)**

- 13 releases between March 2020 and January 2022
- 3 additional models (all eventually dropped):
 - B.1.1.7 (alpha)
 - B.1.525
 - 28254-deletion
- allow some alerts for non-essential ORFs without failing sequence
(they become a `misc_feature` instead)

Faster SARS-CoV-2 sequence validation and annotation for GenBank using VADR

Original article

Influenza sequence validation and annotation using VADR

Vincent C. Calhoun, Eneida L. Hatcher, Linda Yankie, Eric P. Nawrocki *

National Center for Biotechnology Information, U.S. National Library of Medicine, National Center for Biotechnology Information, 8600 Rockville Pike, Bethesda, MD 20894, United States

Additional VADR models and development

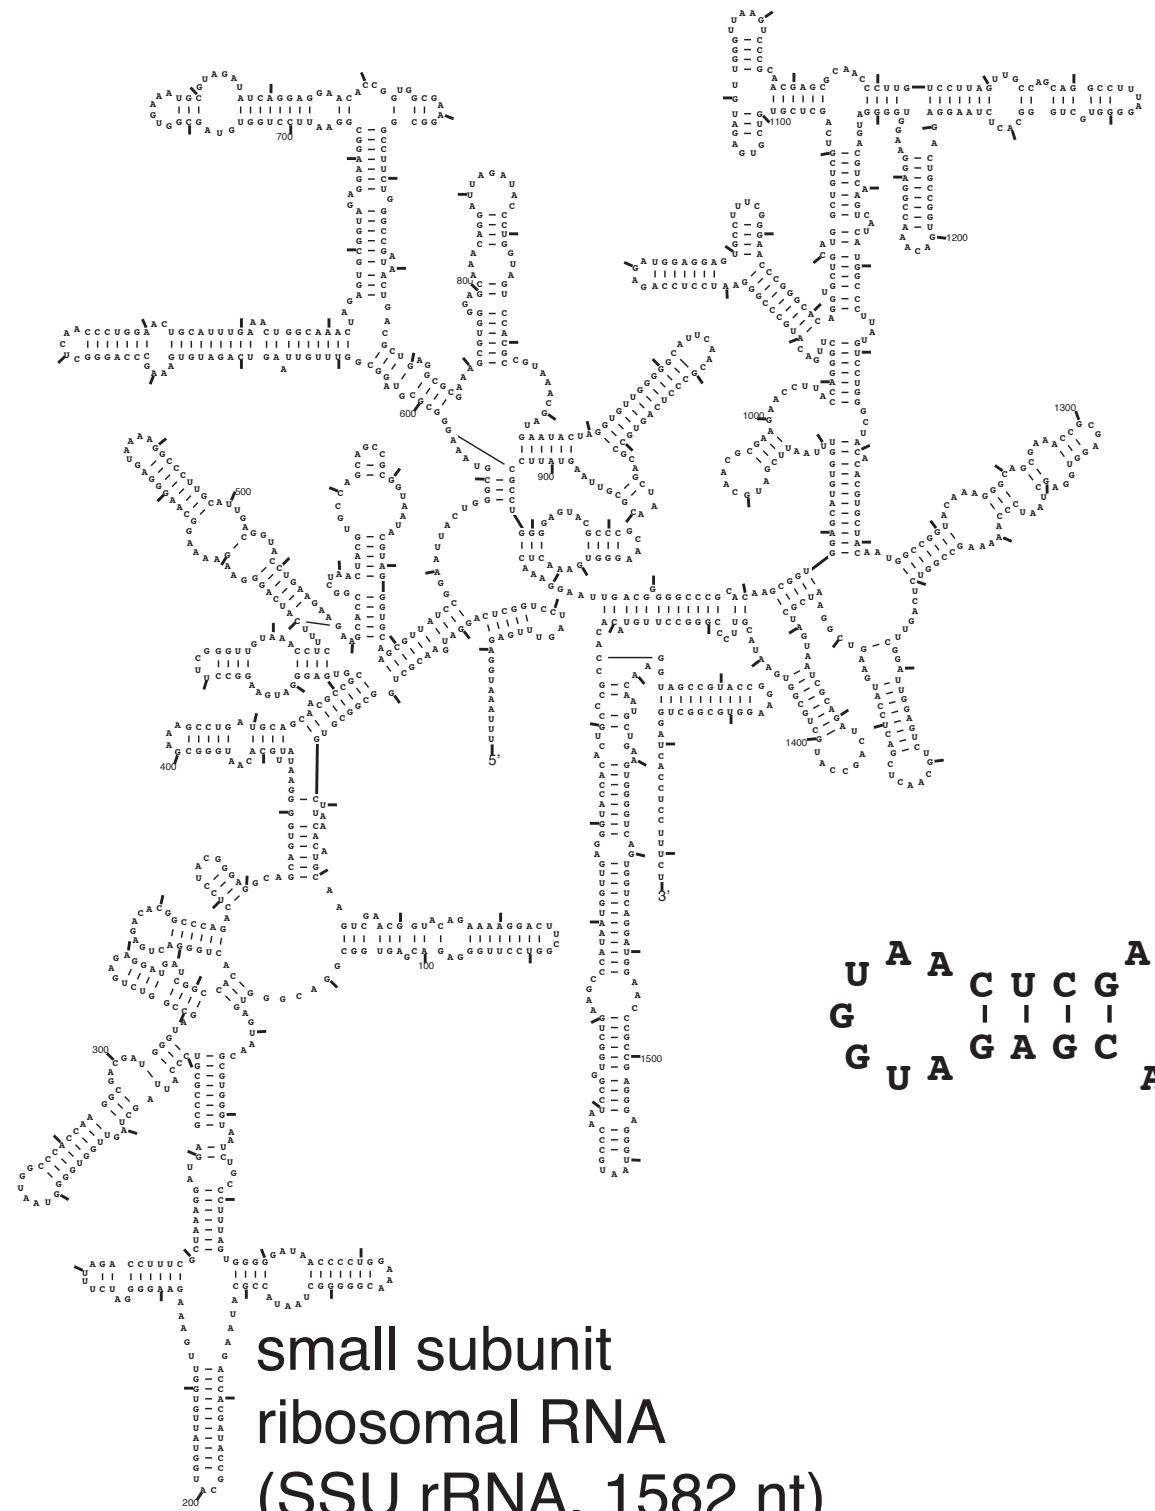

- Alex Greninger's lab at Univ of Washington:
 - sequences a wide variety of human pathogenic viruses
 - previously developed the VAPiD software tool for validating and annotating viral sequences
 - now a collaborator that builds VADR models

Additional VADR models and development

	length	num models	new feature(s)		author
RSV	15Kb	2	alignment-based models		Eric Nawrocki
COX-1	1.5Kb	86	protein-coding gene		Eric Nawrocki
Mpox	197Kb	1	minimap alignment		Eric Nawrocki
Influenza	1-2Kb	70	segmented virus		Eric Nawrocki
Zika	11Kb	?	?		EB Dickinson
Herpes Simplex Virus (HSV)	150Kb	2	-		Jaydee Sereewit (Greninger Lab)
Human meta-pneumovirus (HMPV)	13Kb	6	-		Jeffrey Furlong (Greninger Lab)
Human para-influenza virus (HPIV)	15Kb	5	-		Jeffrey Furlong (Greninger Lab)

Future directions for VADR

- NCBI Virus FY2025 goals:
 - VADR web server
 - Replacement of FLAN with VADR
- Models for more viruses (our group and Greninger lab)

database of more than 4100 non-coding RNA families
each represented by a secondary structure, alignment, and covariance model.

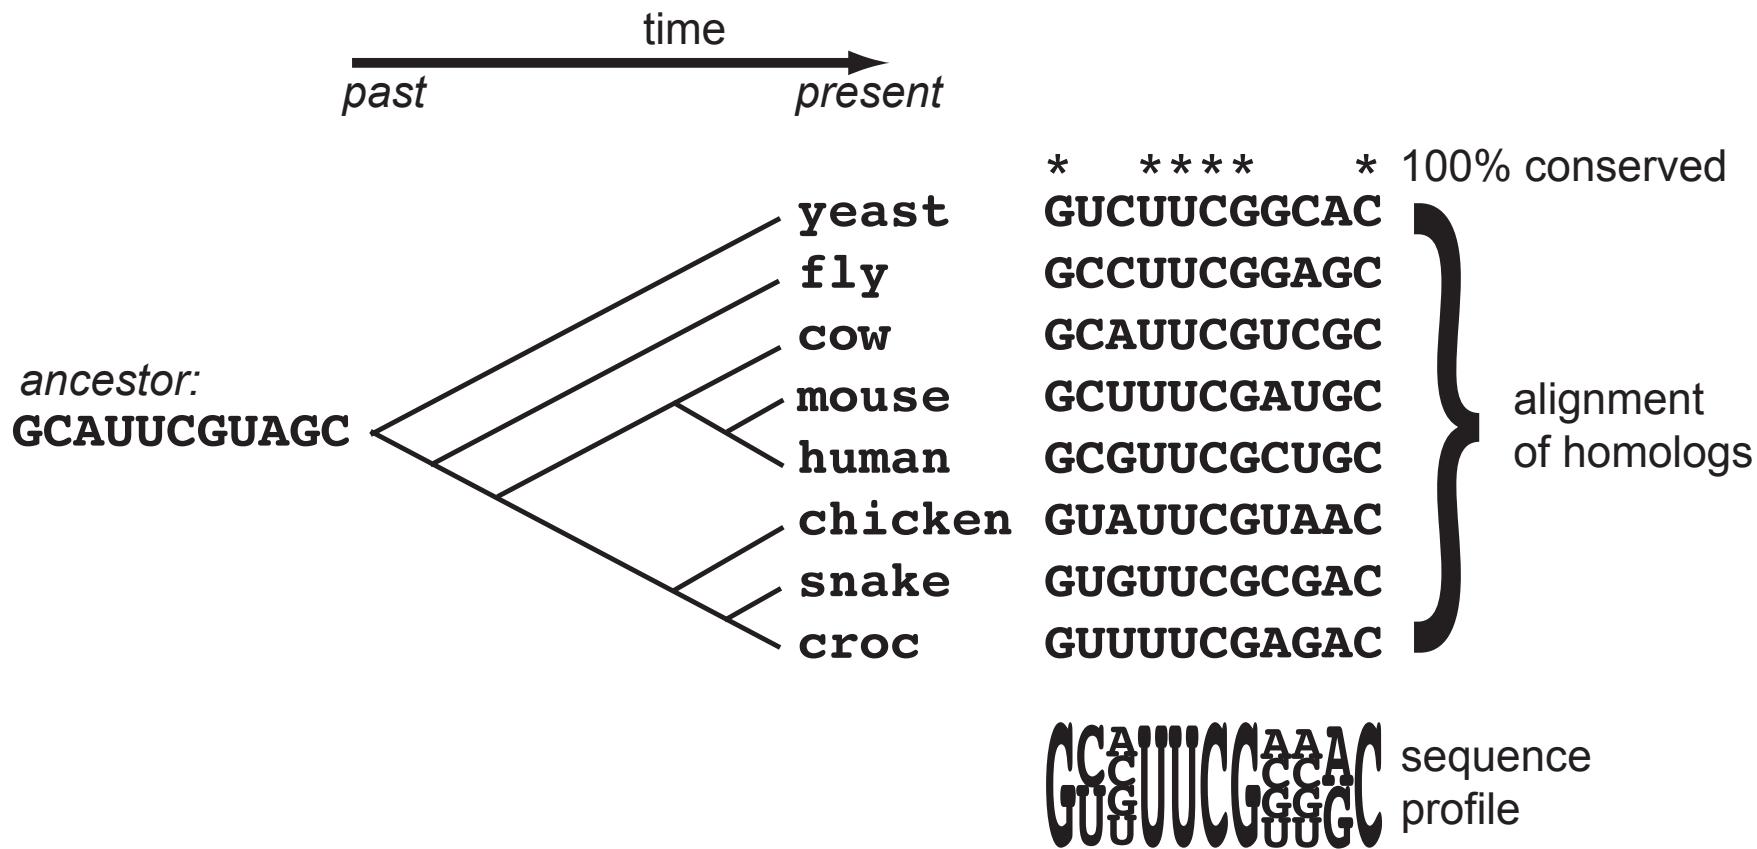

Many functional RNAs adopt a conserved 3-dimensional structure

- BLAST: given a single sequence, search genomes for similar sequences.
- Structural RNAs are difficult to find
 - short (~ 100 nt) and evolve rapidly at sequence level
 - lack open reading frames
 - small, 4 letter alphabet
- BLAST cannot take advantage of:
 - sequence conservation, which varies across the gene
 - secondary structure

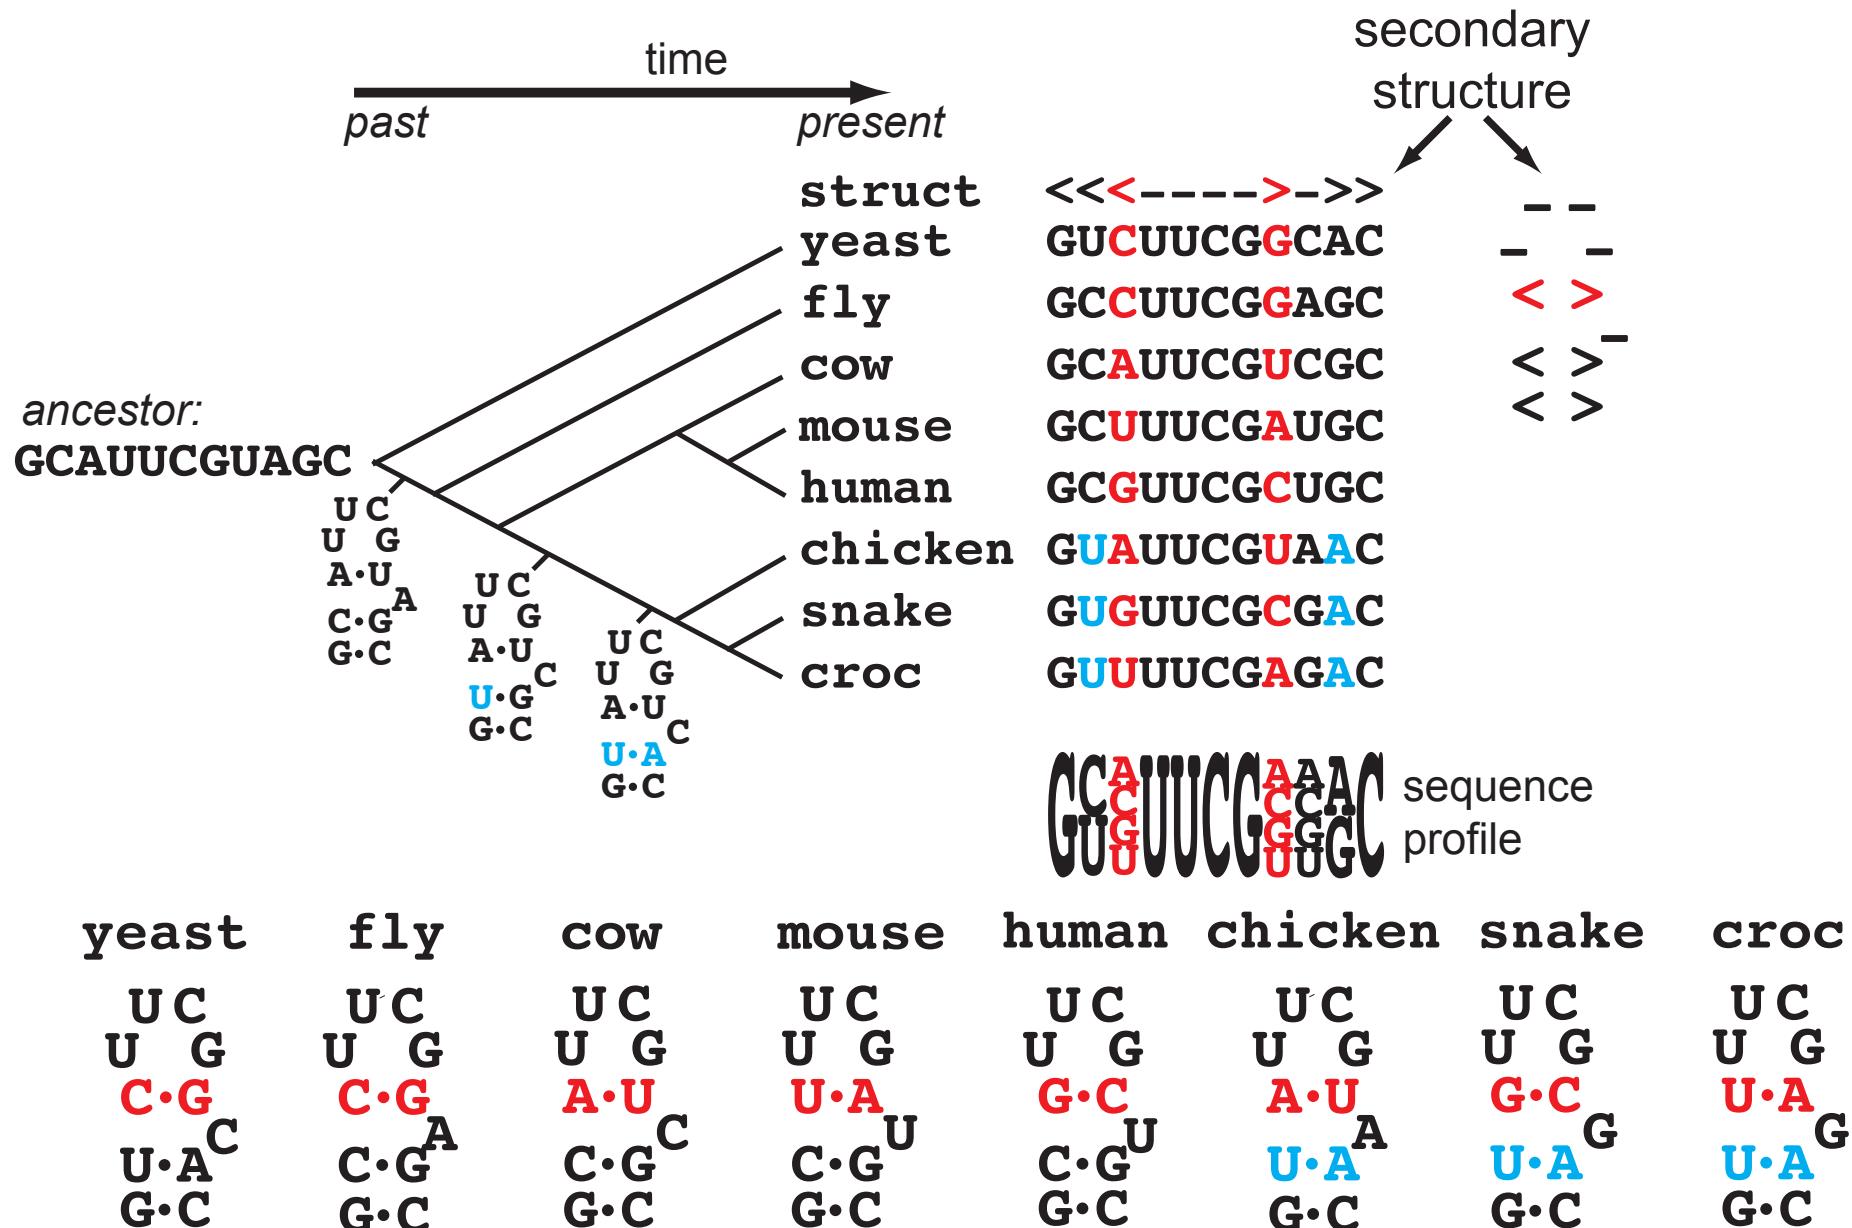

Sequence conservation provides information for homology searches

Conservation levels vary across alignment columns.

Structure conservation provides additional information

Base-paired positions covary
to maintain Watson-Crick complementarity.

profile HMMs and covariance models

	sequence profiles	sequence and structure profiles
models	profile HMMs	covariance models (CMs)
software	HMMER	Infernal
main use	proteins, repetitive DNA elements	structural RNAs
databases	Pfam and Dfam (23794 and 4150 entries)	Rfam (4178 families)
performance for RNAs	faster but less accurate	slower but more accurate

Filter target database using profile HMMs*

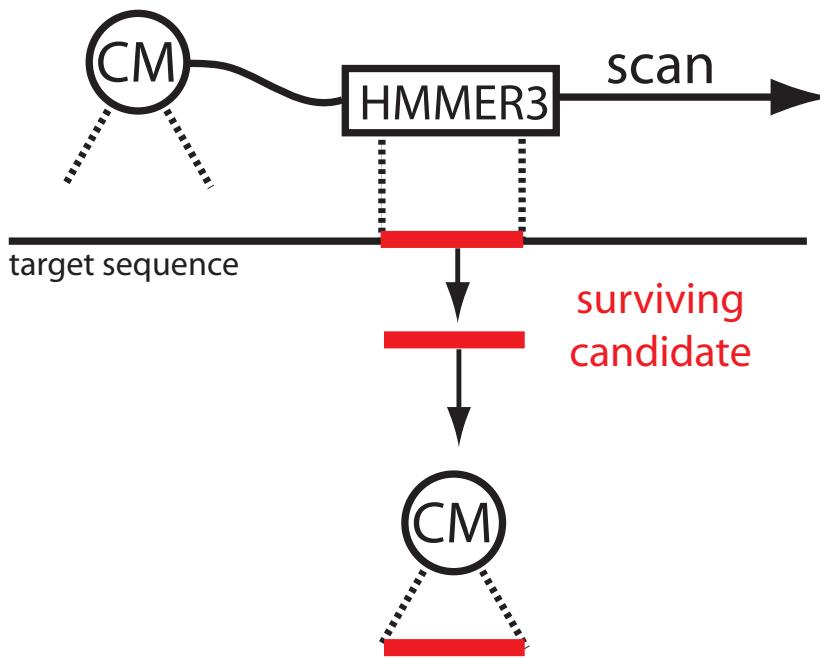

HMM filter first pass

*Weinberg, Ruzzo, RECOMB, 243-251, 2004; Weinberg, Ruzzo, Bioinformatics, 22(1) 35-39 2006.

Filter target database using profile HMMs*

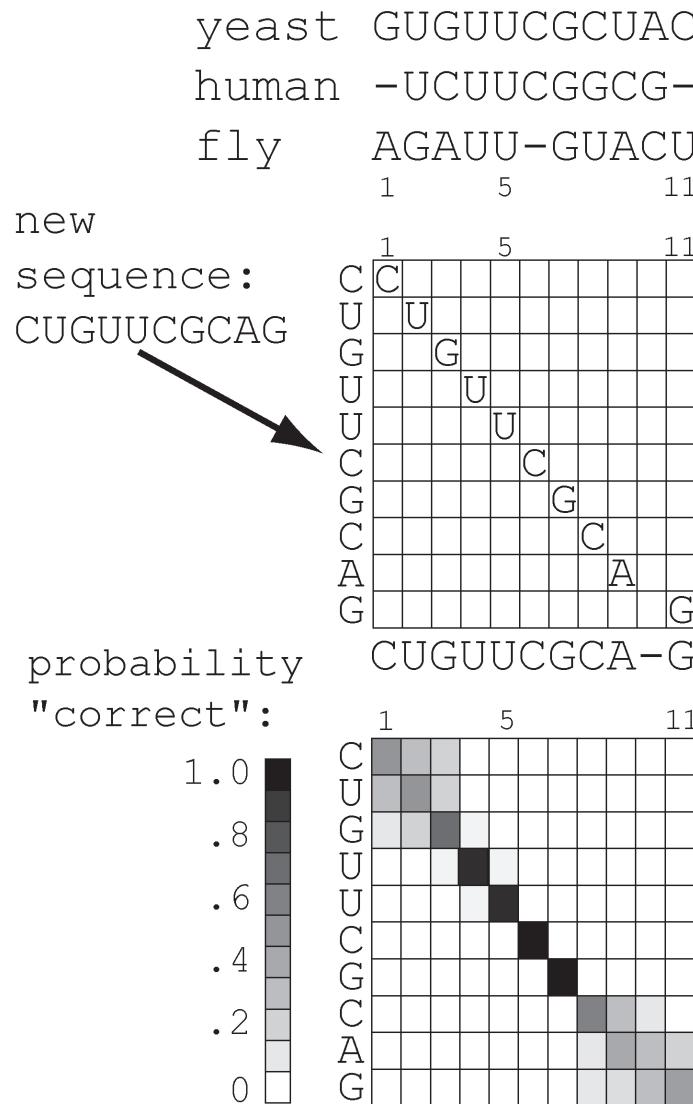

HMM filter first pass

- Even if we filter out 99% of the database (for up to 100X acceleration), searches will still be too slow.
- CM step needs to be accelerated.

*Weinberg, Ruzzo, RECOMB, 243-251, 2004; Weinberg, Ruzzo, Bioinformatics, 22(1) 35-39 2006.

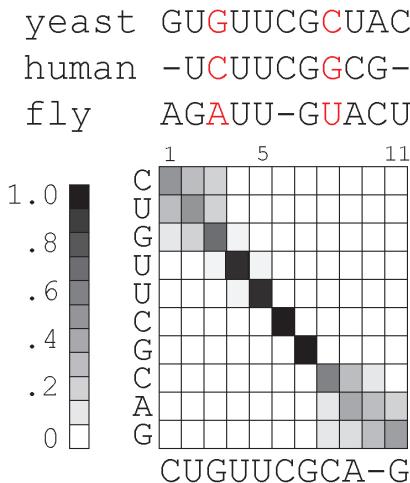

Accelerating CM alignment step 1: HMM posterior decoding to get confidence estimates

Accelerating CM alignment step 2: use HMM alignment confidence to constrain CM alignment

HMMs -

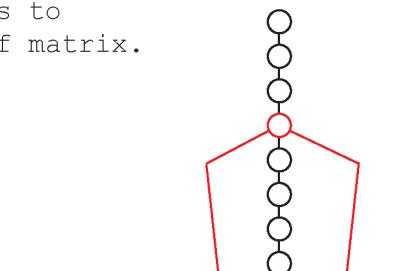

Each column of seed alignment corresponds to a column of matrix.

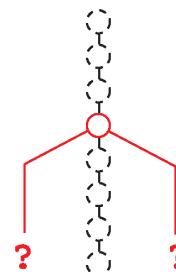

CMs -

Each column of seed alignment corresponds to a state.

Future directions for structural RNA research

- Further development of Infernal
 - iterative search
 - meta-models for clade-specific scoring
- Structural RNA annotation
 - group I introns: improved covariance models for Rfam
 - viral structural RNA annotations by VADR

Profile HMMs: sequence family models built from alignments

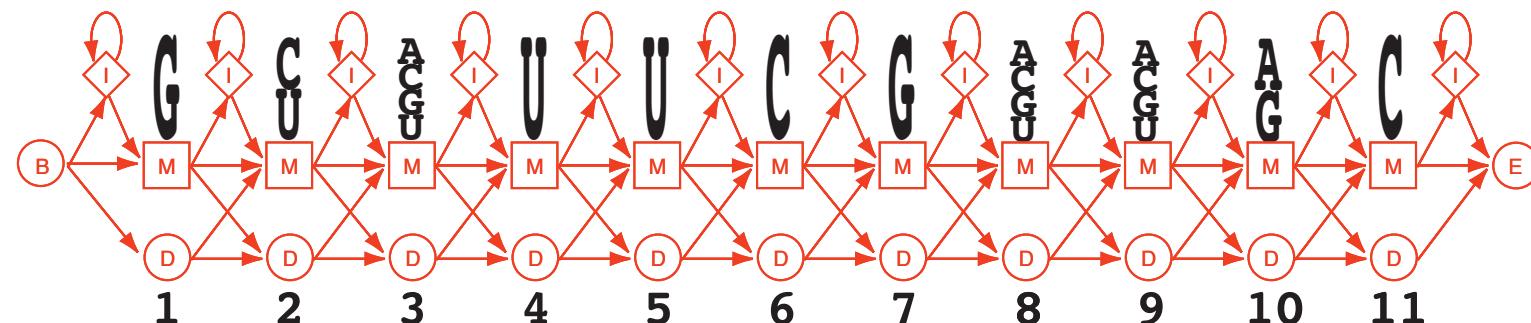

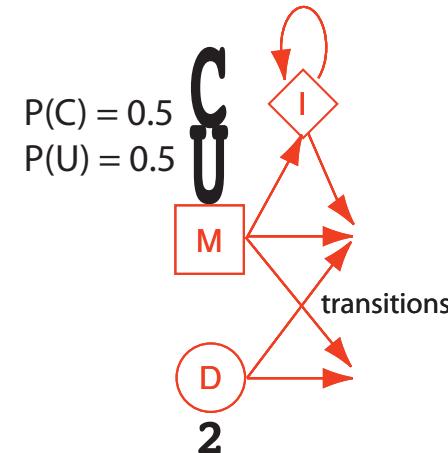

One HMM node per alignment column

3 states per node:

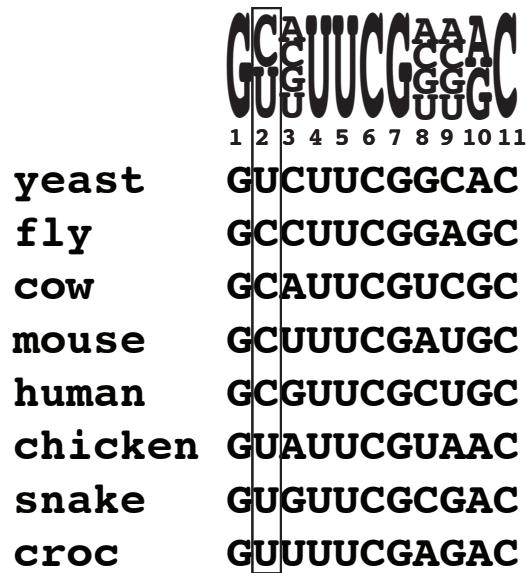

- (M) Match: emits residues
- (I) Insert: inserts extra residues
- (D) Delete: deletes residues

HMMs generate homologous sequences.

Node for column 2:

Profile HMMs: sequence family models built from alignments

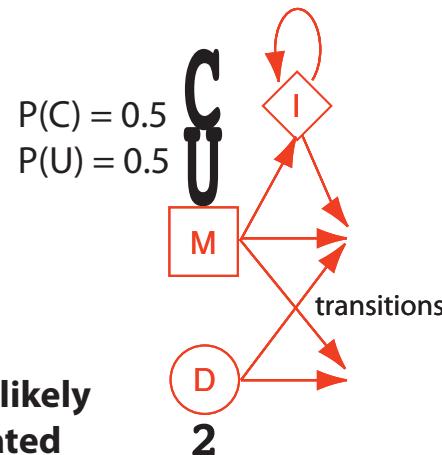

One HMM node per alignment column

3 states per node:

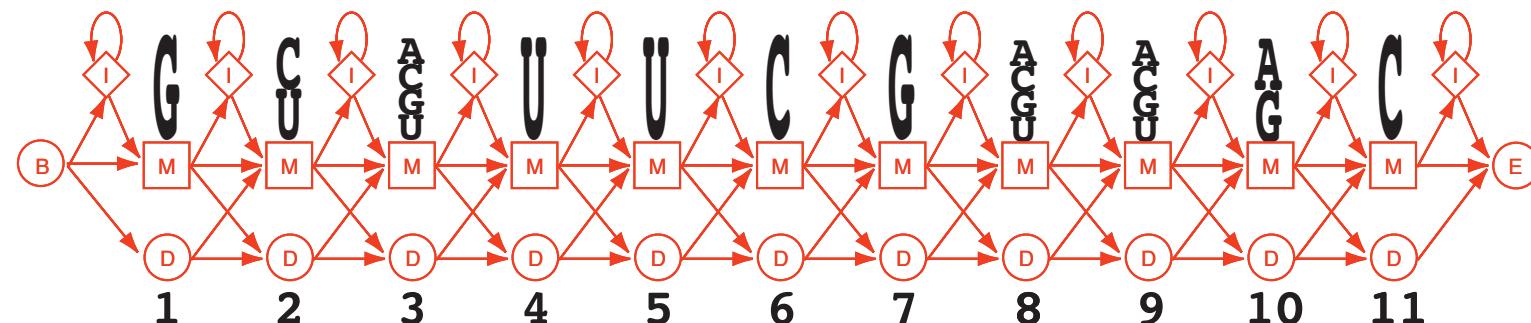

- (M) Match: emits residues
- (I) Insert: inserts extra residues
- (D) Delete: deletes residues

Node for column 2:

HMMs generate homologous sequences.

Given a sequence, the most likely path that could have generated that sequence can be computed.

human	GC. GUUCGCUGC
chicken	GU. AUUCGUAAC
snake	GU. GUUCGCGAC
croc	GU. UUUCGAGAC
worm	GC. GUUCGCGGC
corn	GUGAUUCGU. GC

One HMM node per alignment column

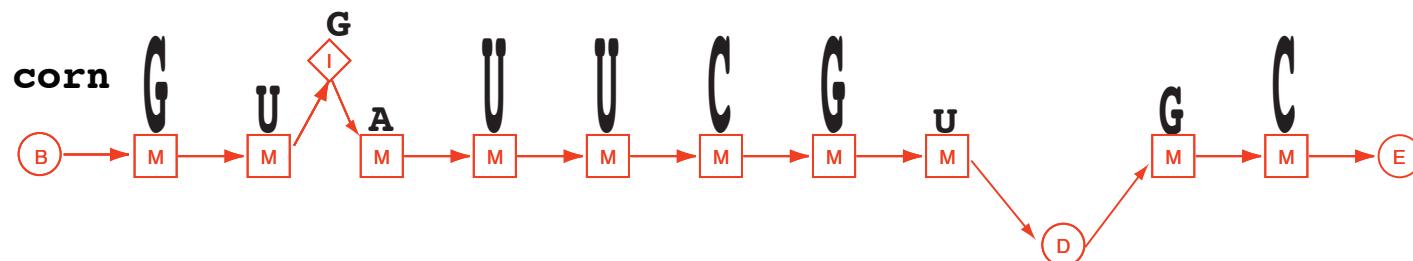

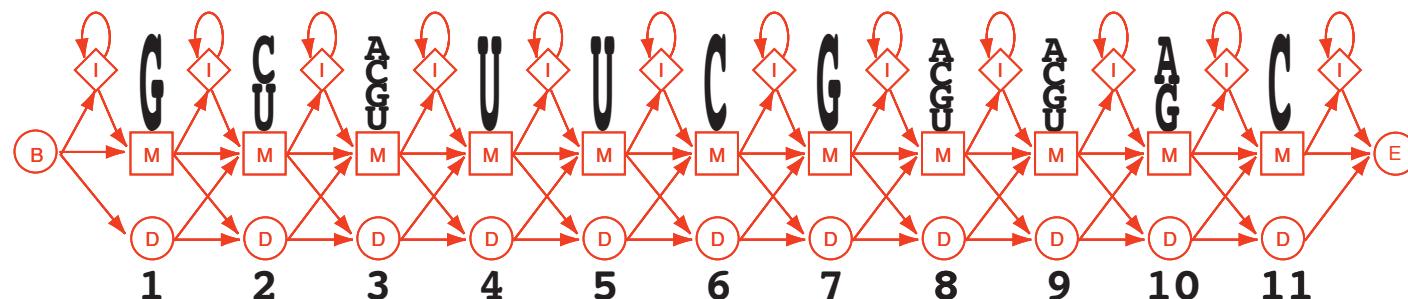

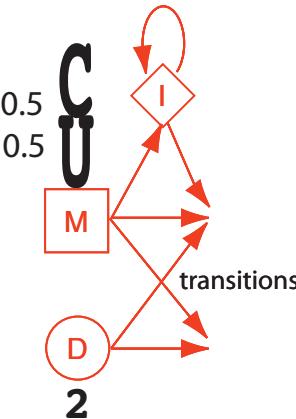

3 states per node:

- (M) Match: emits residues
- (I) Insert: inserts extra residues
- (D) Delete: deletes residues

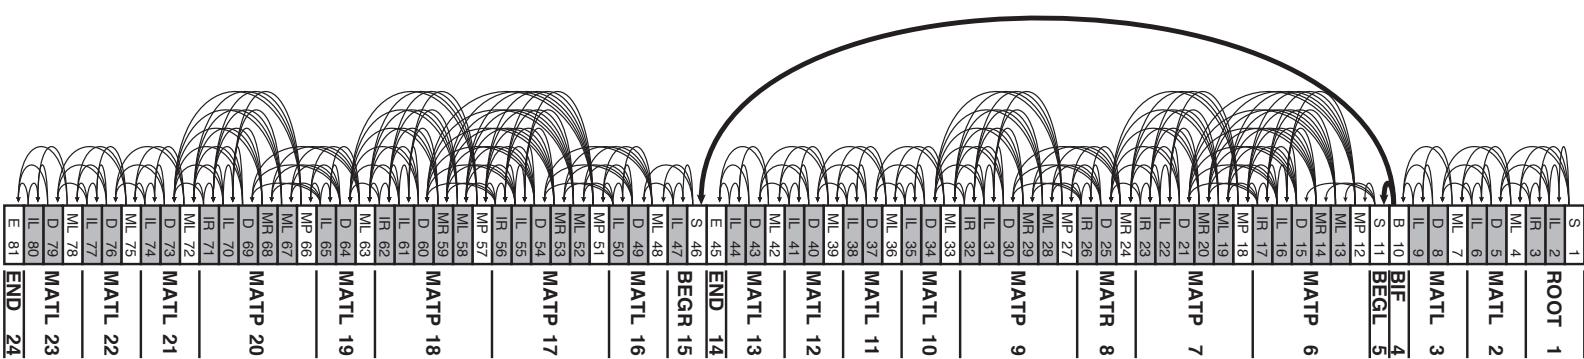

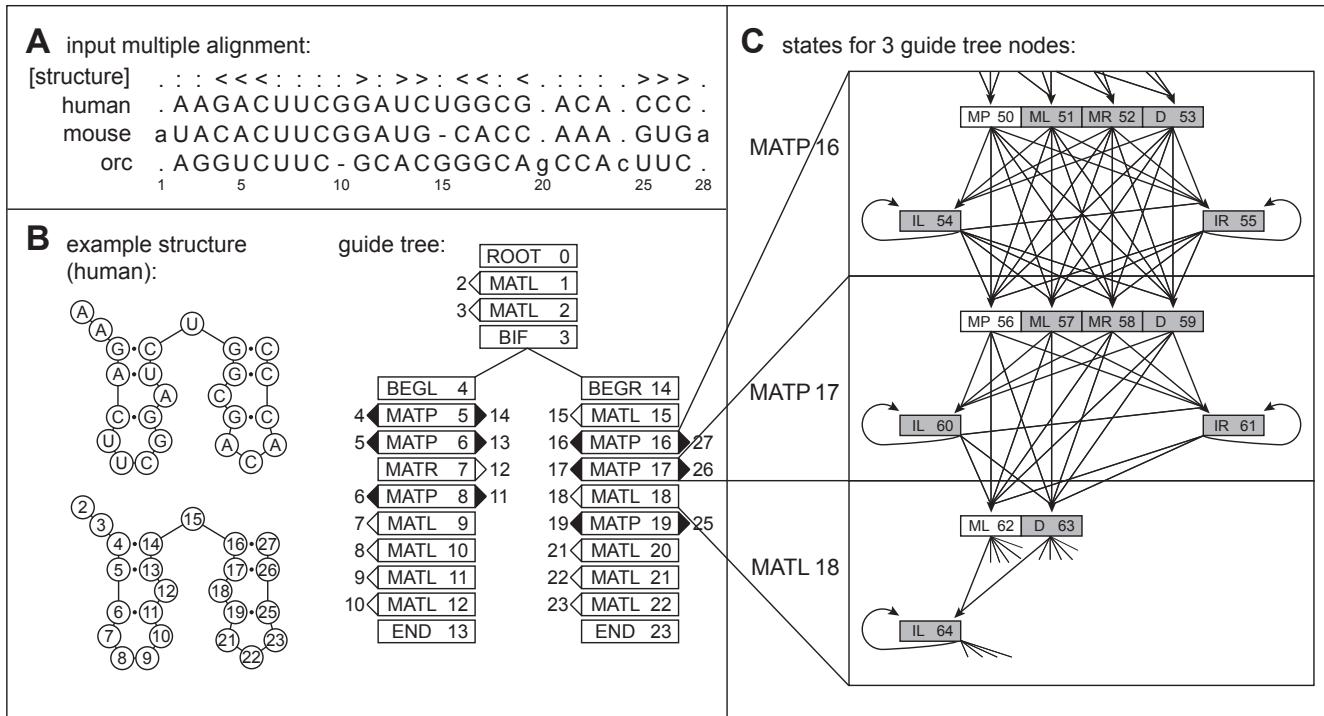

HMMs generate homologous sequences.

Given a sequence, the most likely path that could have generated that sequence can be computed.

Node for column 2:

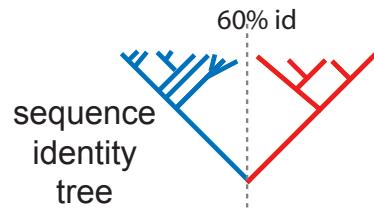

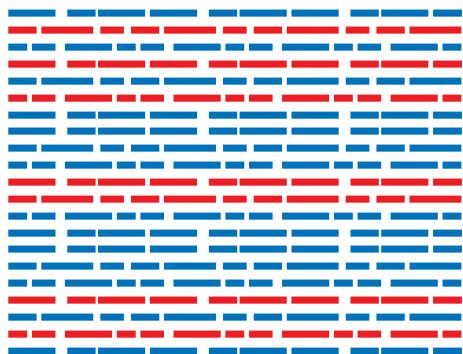

Covariance models (CMs) are built from structure-annotated alignments

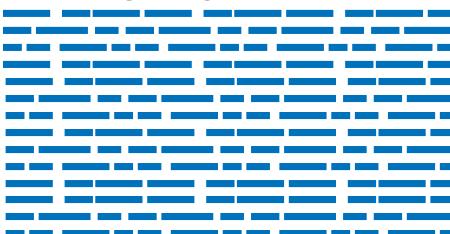

Is the added complexity worth it?

RMARK: a challenging internal RNA homology search benchmark

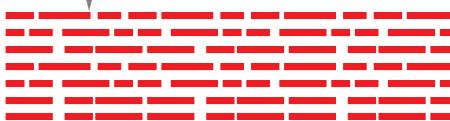

Rfam seed alignment:

training alignment

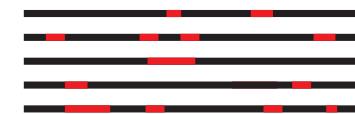

no train/test sequence pair is > 60% identical

test sequences

embed in
pseudo-genome

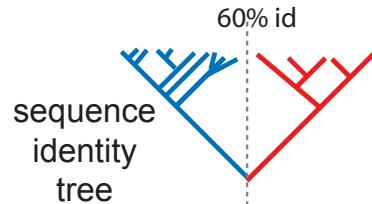

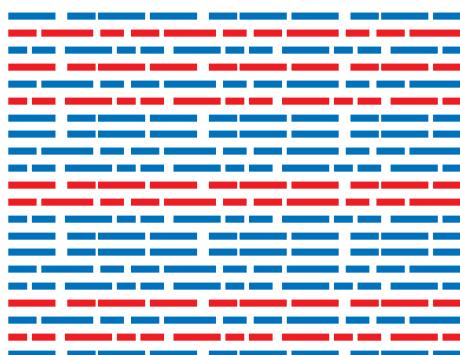

10 1Mb sequences
with 780 embedded
test seqs from 106 families
